To whom it may concern,

The new permit that the Washington state department of ecology is trying to impose would be a nuisance adultididing and vector adulicting until the disease is sustained for the season. This means that are district cannot fog in till the disease is sustained for the season. Which also means that we are going to wait until the disease is spread throughout are whole district before we decide to do anything about it and by that time it would be too late. Not only that when people try to enjoy the nice outdoors but they wouldn't be able to do that cause there are too many mosquitoes and about a 95% chance that you can catch a deadly disease.

I live in an area were water surrounds me and there are still too many mosquitoes even when we do fog so imagine if we didn't fog. I think that I am willing to put a little chemicals in are water to get rid of a lot more problems that we will have if we don't take care of the mosquitoes right when it starts, instead of waiting tell it gets way worse and then we can't take care of it. One more reason we have mosquito control for a reason to control mosquitoes. So how about we use it and pay them for what they are supposed to do.
