

**General Information**

|                           |  |
|---------------------------|--|
| Project Title             | Beaver Habitat Analysis and Management in Eastern Washington   |
| Project Short Description | The Lands Council (TLC) will develop a model of habitat suitability and restoration potential for beaver in Eastern Washington that would help locate suitable beaver project focus areas and evaluate population dynamics and trends. This would lead to decision criteria for future beaver management decisions related to nuisance management, relocations, and research, and could be modified for any region. TLC will also perform various beaver management activities in local watersheds.  |
| Project Long Description  | <p>Beavers have been established increasingly as ecosystem engineers as their activities broadly influence many plants and other animals and offer significant environmental benefits. They are especially important in the Western US where riparian and wetland habitats comprise less than 2% of the landscape yet support up to 86% of wildlife species. Beaver dams retain excess sediment and create wetlands, while plant communities supported by wetlands utilize excess nutrients in the water, making for cleaner water downstream. Beaver-created wetlands also provide important habitat for fish rearing, migratory water fowl, and many other species of fauna. A complex network of beaver dams improves water storage and attenuates flooding events in the spring, while slowly releasing this water in the summer and fall, improving late-season flow. The Lands Council, along with representatives of the US Forest Service, Department of Transportation, Washington Department of Fish and Wildlife (WDFW), and trappers alike, recently participated in a statewide beaver management forum in order to share information, latest technologies, and obstacles of beaver management in Washington. The group identified desired outcomes to improve management, and a primary outcome is the improvement of beaver habitat suitability modeling. This would inform beaver management officials throughout the state where suitable habitat needs to increase, what sort of marginal habitat beaver are currently occupying, locations of potential relocation sites, and more.</p> <p>The Lands Council has the background and experience to improve this sort of habitat modeling. In 2011, TLC staff worked with state legislators to pass a bill to improve beaver management and record keeping throughout the state, which we will use in our analysis. Our work will expand on present models, such as that implemented by the Lands Council in 2009 and the BRAT model used in Utah by the Grand Canyon Trust. The model will use data from a variety of sources, including USGS data on land cover, land use, and protected areas; WDFW data on beaver trapping, nuisance complaints, and beaver relocations; USFS data on riparian vegetation; and data collected by TLC regarding vegetative habitat type currently in use by beaver. This will create a model that has implications and usefulness for other groups working in beaver management across the state and country.</p> <p>Simultaneously we have the capacity to carry out on-the-ground management techniques to resolve beaver and landowner conflict in order to retain maximum ecosystem services. Currently calls to the local WDFW offices regarding nuisance beaver can be directed to us and we receive over 10 cases annually to</p> |

# WATER RESOURCES WATERSHED PLAN IMPLEMENTATION AND FLOW ACHIEVEMENT

Organization: The Lands Council

WRPIFA-1517-TLC-00044

## General Information

work with. We will perform beaver management activities in local watersheds that include installing pond-leveling devices and culvert protectors to reduce property damage while retaining ecosystem services. In some cases we will relocate nuisance beaver populations to suitable habitat in the Colville National Forest in order to maximize the chances of water storage and riparian enhancement. Biologists in the Colville National Forest are supportive of our project and allow relocations to take place within the forest and share habitat information with us.

This project has been discussed and approved by the Spokane Regional Watersheds group, consisting of WRIAs 54, 55/57, and 56. Nuisance management in order to protect beaver maintained streams and wetlands will occur within these watersheds, while GIS analysis will take place across Eastern Washington.

Total Cost \$53,000.00\* Total Eligible Cost \$46,000.00\*

Will Environmental Monitoring Data be collected? No

Overall Goal While statewide beaver management has improved, opportunities to take advantage of beaver ecosystem services are still missed. Analyzing spatial data showing nuisance complaints filed with WDFW will show any hotspots of activity where citizens need assistance and education regarding beaver benefits. Analyzing the vegetative habitat used by beaver will show what sort of marginal habitat beaver currently occupy which will help inform decisions regarding criteria for relocation sites. Further analysis will reveal habitat corridors used by beaver and where riparian restoration of one area would potentially connect two larger areas of habitat. By developing this model we hope to answer these questions and more and share our methods with other beaver management groups throughout the country to help optimize beaver management. By simultaneously enacting beaver management such as beaver relocations we hope to continue our work toward habitat improvement and water storage in Eastern Washington.

Task Description: Building on existing models, create a GIS framework for beaver habitat suitability modeling in Eastern Washington

Task Goal Statement: To develop a GIS model that will better inform beaver management decisions, optimize beaver ecosystem services, and that can be used by beaver management professionals across the country

Task Expected Outcomes: A compilation of GIS layers within a geodatabase, to be submitted to Ecology along with metadata and a report describing the methods and analysis

Recipient Task Coordinator: Amanda Parrish  
06/30/17

If you receive a grant, you are responsible for procuring professional, personal, or other services using sound business judgment and good administrative procedures consistent with applicable state, and local laws, orders, regulations, and permits. This includes issuance of invitation of bids, requests for proposals, selection of contractors, award of sub-agreements, and other related procurement matters.

- 1 Fill in either the "Salaries" field and the "Benefits" field or fill in the "Salaries and Benefits Combined" field
- 2 Upload an itemized list of all equipment and explain why the equipment is needed. Equipment is defined as tangible property other than land, buildings, improvements other than buildings, or infrastructure, which is used in operations and with a useful life of more than one year. Examples are furnishings, equipment, and software.

# WATER RESOURCES WATERSHED PLAN IMPLEMENTATION AND FLOW ACHIEVEMENT

Organization: The Lands Council

WRPIFA-1517-TLC-00044

## Budget Proposal

3 Upload an itemized list of all Goods and Services

4 Overhead cannot exceed 25% of salaries/benefits

### Additional Comments

A \$5,000 contract will go toward hiring a GIS intern during the first fiscal year to assist with GIS analysis.

Travel was estimated as follows:

3 in-stream devices sites x 60 miles round trip x 4 visits annually x 0.55\$ per mile = approximately \$400 per year

2 relocation sites x 300 miles round trip x 3 visits annually x 0.55\$ per mile = approximately \$1,000 per year

## **OTHER PROJECT TYPE INFORMATION**

### **Instructions:**

Please fill in the appropriate fields.  
Required fields are marked with an \*.  
When done, click the **SAVE** button.

### **Project Location**

\* Stream reach mile or location

### **Funding Source Information**

\* Known (in-hand), estimated or potential funding that is or may be part of the total project provided by sources other than this program

Amount   
Percentage of project budget  %

\* Identify sources and type of funding other than through this grant. Include expected dates of participation. Upload letters of commitment, offer letters, application approvals or other supporting information.

Source and type of Funding

| Amount                                  | Percentage                       | Status                                 | Known or expected date funds will be available                            |

### **Estimated Total Water Savings**

\* Estimate the water to be conserved through efficiency gains from this project. Provide engineering or technical analyses to support your estimates.

| Month          | JAN | FEB | MAR | APR | MAY | JUN | JUL | AUG | SEP | OCT | NOV | DEC | TOT |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| QA (ACRE-FEET) |     |     | 50  | 50  | 75  | 75  | 100 | 100 | 150 | 100 | 50  |     | 750 |
| QI (CFS)       |     |     |     |     |     |     |     |     |     |     |     |     | 0   |

**Instream Flow or Habitat Benefits**

\* Briefly describe anticipated instream flow or habitat benefits as a result of funding this project proposal:

Estimates for water conserved are derived from the following formula:  
 4 dams/mile x 2 miles x 30.5 acre feet/dam = 244 acre feet annually from preventative management. Approximately half of that is estimated to be conserved from 2 annual beaver relocations. A study by Glynnis Hood and Suzanne Bailey, Beaver mitigate the effects of climate on the area of open water in boreal wetlands in western Canada, 2007, shows that in similar drought years in the same region, there was 1.6 times more open water when beaver were present than when they were absent. Dams will help store spring runoff and release water later in the year, increasing summer flows. Beaver dams create heterogeneous, complex riparian areas and wetlands, while plant communities supported by wetlands utilize excess nutrients in the water, making for cleaner water downstream. The implications of our GIS analysis will further improve beaver management so that these ecosystem services can be maximized across the state.

**Resources currently committed to ensure long-term performance of the proposal**

\* Who will be responsible for long-term operations and maintenance of the project?

The Lands Council will be responsible for long-term maintenance in some instances, and we will work with landowners in other instances. In terms of tree protection, once TLC does the initial installation, landowners will be responsible for tree fencing going forward. The pond-leveling devices need to be checked 3-4 times per year initially, but only once per year in the future. TLC staff, interns, and volunteers will check to make sure the inlets are not plugged and device still functions. The beaver dams themselves are inherently temporary, and while staff will monitor sites to record beaver activity, extent of surface water inundation, and more, the beavers will naturally maintain the ecosystems without assistance.

726 of 1000

\* Have operations and maintenance costs been identified?  Yes  No

\* Summarize the estimated costs on an annual basis below if possible at this time:

In the first two years, maintenance costs approximately \$3,000 annually for staff time, with an estimated 25 hours per year of volunteer help valued at \$500 annually. After two years, maintenance will cost approximately \$500 worth of staff time and travel reimbursement per site.
