I. INSPECTION REQUIREMENTS

I.1 Inspection Plan

This section describes the method and schedule for inspections of the IDF. These inspections help to ensure that situations do not exist that might cause or lead to the release of waste to the environment, degradation of safety equipment and/or systems, or that might pose a threat to human health. Abnormal conditions identified by inspections must be corrected.

I.1.1 General Inspection Requirements

The content and frequency of inspections are described in this section. Inspection discrepancies are documented on inspection checklists and log sheets. The schedule and inspection records will be kept in the inspection logbooks and retained by the IDF operations personnel. Inspection records will be retained in accordance with Permit Condition II.1.1 and contain the following information:

- Date and time of inspection
- Printed name and the hand written signature of the inspector
- Notation of the observations made
- An account of spills or discharges in accordance with WAC 173-303-145
- Date and nature of any repairs or remedial actions taken.

The inspection checklists consist of a listing of items that are assessed during each inspection. A yes/no response will be made for each listed item. A 'yes' response means that the item is in compliance with the conditions stated on the checklist. Any problems identified during the inspection, as indicated by a 'no' response on the checklist, will be reported immediately to the IDF operations supervisor.

I.1.1.1 Types of Problems

Types of problems looked for during an inspection in Pre-Active Life are in Table I.2. Types of problems looked for during an inspection in Active Life are in Table I.3. Once the IDF begins to receive dangerous waste, the requirements in Table I.2 are no longer applicable. Each day mixed waste containers and/or bulk waste are handled within the IDF; an operator will perform a daily inspection of areas subject to spills (e.g., loading and unloading areas and waste handling areas).

I.1.1.2 Frequency of Inspections

Table I.2 provides inspection frequencies during the Pre-Active Life. Tables I.1 and I.3 provide inspection frequencies during the Active Life. For clarification, areas with operations that may result in spills are described below.

Each step in the waste placement operation occurs in the landfill over the double HDPE liner system that provides containment of any spill from the waste handling operation.

Waste Handling Operations involve the following:

- Unloading of the waste shipment in the landfill Placement of the cover soil over the waste container
- During Active Life leachate, movement occurs within the double-contained leachate handling system.
- There is a potential for a leachate spill on the concrete containment slab of the Crest Pad Building, Leachate Transfer Building, and/or the Leachate Loading Truck Pad.

Leachate Handling Operations involve the following:

- Pumping leachate from the collection sumps to the Crest Pad Building
- Activities within the Crest Pad Building

---

1 WAC 173-303-040 defines "Leachate" as any liquid, including any components suspended in the liquid that has percolated through or drained from dangerous waste.
- Transfer of leachate to and from the double-lined Leachate Tanks
- All activities that occur in the Leachate Transfer Building
- Pumping of leachate to a tanker truck on the Truck Loading Pad

Liquid handling operations involve the following:

- The Secondary Leak Detection System (SLDS) is similar to the LDS, except that it is equipped with liquid level indication instrumentation only. A low-capacity submersible pump can be inserted into the SLDS sump if required. Pumping of liquid from the collection sump to the small, portable container on the SLDS Pad may be required. Collected liquid in the SLDS that may be construction water and/or liquid from other sources.

Note: The secondary leak detection system is not a design requirement of WAC 173-303-665, however DOE has added the design feature pursuant to its authority under the Atomic Energy Act of 1954 (AEA) and not for the purposes of compliance with the dangerous waste regulations. Therefore, information regarding the design, construction, and operation of the SLDS is provided for information only. Pursuant to AEA, DOE has sole and exclusive responsibility and authority to regulate the source, special nuclear and by-product material component of radioactive mixed waste at DOE-owned nuclear facilities. Source, special nuclear and by-product materials, as defined by AEA, are not subject to regulation under RCRA or the Hazardous Waste Management Act, by the State of Washington and are not be subject to State dangerous waste permit, orders, or any other enforceable instrument issued there under. DOE recognizes that radionuclide data may be useful in the development and confirmation of geohydrologic conceptual models. Radionuclide data contained herein is therefore provided as a matter of comity so the information may be used for such purposes.

### I.1.2 Schedule for Remedial Action for Problems Revealed

The operating organization will remedy any problems revealed by the inspection on a schedule that prevents hazards to human health and the environment. Where a hazard is imminent or already has occurred immediate action will be taken. Immediate actions will be implemented based on ALARA considerations, availability of supplies, equipment, and personnel.

### I.1.3 Specific Process or Waste Type Inspection Requirements

The following sections detail the inspections to be performed at the IDF.

#### I.1.3.1 Container Inspection

On receipt, operations personnel will confirm appropriate documentation by inspecting each mixed wasted container for disposal and compliance with the container receipt inspection criteria (Addendum B) before the mixed waste is placed in the IDF.

If present, off-specification waste and vitrified waste requiring cooling in storage will be subject to the specific items and/or problems noted during weekly container inspection (Table I.1) include the following:

- Condition of trench floor and sides
- Container structural integrity
- Containers closed
- At a minimum, 76.2 centimeters aisle spacing
- Corrosion of containers
- Evidence of spills or leaks
- Container labels and markings in place, legible, and unobscured
- Areas in and around stored waste are free of combustibles (e.g., tumbleweeds)
- Waste separations such as tape, rope, chain or other cordon mechanism are intact.
If present, transport vehicles containing off specification waste or vitrified waste requiring cooling will be subject to the specific items and/or problems noted during weekly inspection include the following:

- Transport vehicle structural integrity
- At a minimum, 76.2 centimeters aisle spacing between transporters
- Evidence of spills or leaks
- Areas in and around transport vehicles are free of combustibles (e.g. tumbleweeds)
- Separations such as tape, rope, chain or other cordon mechanism are intact.

Transport vehicles will not be subject to an individual container inspection within the transporter. Records of inspection will be maintained as detailed in Section F.2.1.

I.1.3.2 Landfill Inspection

The IDF will be inspected according to the frequencies in Table I.2 during Pre-Active Life and in accordance with Table I.3 during Active Life.

I.1.3.2.1 Run-on and Runoff Control System

A run-on control system is installed around the perimeter of each lined trench (Addendum C). The system consists of a berm along the outer margin of each trench that prevents run-on from entering the trench. All run-on control system berms are inspected quarterly (Table I.2) and after storms for signs of deterioration, malfunction, or improper operation. During Active Life, any precipitation that falls between the run-on control berm and the edge of the trench excavation eventually might flow into the primary leachate control and removal system sump and will be treated as leachate.

I.1.3.2.2 Leak Detection System

Leak detection for lined trench at the IDF is accomplished by the following:

- Monitoring liquid level above the secondary liner
- Monitoring liquid levels above primary liner
- Inspecting for the presence of liquids after significant precipitation events
- Verifying certain gauges and instruments are in current calibration; calibration is performed annually or more frequently at intervals suggested by the manufacturer (Addendum C, Section C.3.7.4)
- Recording secondary sump levels on a daily action leakage rate calculation sheet (Figure I.1).

If the action leakage rate (Addendum C.4) has not been exceeded, the liner system will be functioning properly.

I.1.3.2.3 Wind Dispersal Control System

Waste is inspected on receipt for evidence of damage, corrosion, or deterioration that might lead to dispersal of the contents.

Unpackaged or bulk waste with any potential for wind dispersal is covered or sprayed with fixative after being placed in a trench.

In addition, unpackaged or bulk waste handling operations are suspended in winds exceeding 24 kilometers per hour unless specifically approved by operations supervisors. The supervisor only would grant approval to operate in winds over 24 kilometers per hour after determining that the risk to human health or the environment would be diminished by completing the work activity, or that the nature and form of the waste handling activity was such that the wind speed would have no significant impact.
I.1.3.2.4 Leachate Collection and Removal System

Liquids in the Leachate Collection and Removal System and Leak Detection System are monitored daily to ensure the action leakage rate (Addendum C.1) is not exceeded and will be inspected per Table I.2. In addition, a flow meter is used to check if the amount of actual leachate pumped corresponds to the amount accumulated in the leachate collection tank. This check will verify the proper function of the leachate collection and removal sump pumps with each use.

In addition, evaluations on the leachate transfer lines for freeze and thaw damage will be conducted when appropriate.

* A storm is any atmospheric disturbance with either wind gust of 35 miles per hour or greater, or precipitation of 0.5 inch or greater within a 24-hour period.

Note: Secondary leak detection system is not a design requirement of WAC 173-303-665, however DOE is adding the design feature pursuant to its authority under the Atomic Energy Act of 1954 (AEA) and not for the purposes of compliance with the dangerous waste regulations. Therefore, formation regarding the design, construction, and operation of the secondary leak detection system is provided for information only.

Pursuant to AEA, DOE has sole and exclusive responsibility and authority to regulate the source, special nuclear and by-product material component of radioactive mixed waste at DOE-owned nuclear facilities. Source, special nuclear and by-product materials, as defined by AEA, are not subject to regulation under RCRA or the Hazardous Waste Management Act, by the State of Washington and are not be subject to State dangerous waste permit, orders, or any other enforceable instrument issued there under. DOE recognizes that radionuclide data may be useful in the development and confirmation of geohydrologic conceptual models. Radionuclide data contained herein is therefore provided as a matter of comity so the information may be used for such purposes.
