## **Before you print this document**

Chapter 4 with appendices (pages [35-326](#)) and Appendix 6A (pages [339-341](#)) of this document are provided in “landscape” page orientation; all other chapters and appendices are oriented in “portrait.” The appendices in Chapter 4 (pages [103-326](#)) have been designed for duplex printing (front and back side of paper), “open to top” configuration.

## **Purpose and Use of this Plan**

This Geographic Response Plan (GRP) constitutes the federal and state on-scene coordinators' orders during the initial phase of an oil spill response in the planning area. It's meant to aid the response community during the initial phase of an oil spill; from the time a spill occurs until a Unified Command is established. The plan prioritizes tactical response strategies based on locations where spills might occur and the proximity of those locations to sensitive natural, cultural, and economic resources. By using this document it's hoped that immediate and proper action can be taken to reduce oil's impact on sensitive resources.

After a spill occurs, efforts to control and contain the spill at or near the source should be a top priority. Beyond those efforts, the booming and notification strategies provided in Chapter 4 should be implemented as soon as possible using the priority tables in Section 4.3, unless overflight information, spill trajectory models, or circumstances unique to a particular spill situation dictate otherwise. Changes to the order listed in the priority tables may be made if approved by the Incident Commander or Unified Command.

Information meant to support initial Environmental Unit functions can be found in Chapter 6 (Resources at Risk). The chapter and its appendix provide specific information about the type and location of natural and economic resources in the area. Cultural resource locations were considered in the development of this plan but, because of the sensitive nature of the information, specifics about the location of those resources aren't included in this document.

# CHAPTER 1

## Introduction

This plan focuses on sensitive resource protection after an oil spill occurs. It serves as the federal and state on-scene-coordinators' orders during the initial phase of an oil spill response in the Nisqually River area. It has been approved by Regional Response Team 10 and the Chairs and Co-Chairs of the Northwest Area Committee. Changes to this document are expected as more testing is conducted through drills, site visits, and actual use in spill situations. We value your input and hope that you'll let us know how the plan might be improved. Please submit comments online at <http://www.rtt10nwac.com/Comment>. Comments may also be emailed to [GRPs@ecy.wa.gov](mailto:GRPs@ecy.wa.gov) or submitted by mail using the form and information provided in the appendix of this chapter.

This GRP has been developed for the John Day Pool of the Middle Columbia River (MCRJ-GRP). The Columbia River provides a border between Oregon and Washington from the river's mouth, through the John Day-GRP area, to river mile 310 where it leaves Oregon and continues on through Washington State until reaching its origin in Canada. The MCRJ-GRP planning area covers 76 miles of the Columbia River, extending from the John Day Dam at river mile 216.4 to the base of the McNary Dam at river mile 292.5. Numerous cities and towns are located on the banks of the Columbia River within the John Day Pool, including: Arlington, Boardman, Irrigon, and Umatilla, Oregon, with the towns of Paterson and Plymouth on the opposite shore in Washington. Additional information about the planning area, including physical features, hydrology, climate and winds, tides and currents, and spill risks, can be found in Chapter 2 (Site Description). Information about potential response options in the planning area can be found in Chapter 3 (Response Options and Considerations).

The bulk of this plan is contained in Chapter 4. It provides information on tactical response strategies and the order they should be implemented, based on potential spill origin points and their proximity to sensitive resources. Area and sector maps and information on staging areas and boat launch locations are also provided in that chapter.

### **Control and Containment of an Oil Spill are a Higher Priority than the Implementation of GRP Response Strategies**

If in the responder's best judgment, control and containment of an oil spill at or near the source of a spill isn't feasible, or if the source is controlled and contained but oil has spread out beyond initial containment, then the priorities laid out in Section 4.3 of this plan should take precedence until a Unified Command is formed. It's important to note that spill response priorities, beyond those described in this plan, should rely on aerial observations and spill trajectory modeling. A booming strategy listed as a high priority in Section 4.3 would not necessarily be implemented if a spill

trajectory didn't warrant action in that area; however, the priority tables should be followed until spill trajectory information becomes available. During an incident, modifications to the deployment priorities provided in Section 4.3 of this plan may be made if approved by the Incident Commander or Unified Command.

The downstream movement of oil and the time it takes to mobilize response resources to deploy GRP strategies must always be considered when setting strategy implementation priorities. The strategies discussed in this plan have been designed for use with persistent oils that float on water and may not be suitable for other petroleum products or hazardous substances. For hazardous substance spills, refer to the [Northwest Area Contingency Plan](#) (NWACP), Chapter 7000.

Information meant to support initial Environmental Unit functions can be found in Chapter 6 of this document (Resources at Risk). Chapter 6 and its appendix provide specific information about the type and location of natural and economic resources in the area. Specific information about the location of cultural sites in the GRP area were taken into consideration in the development of this plan but such information cannot be provided in this document due to the confidential nature of the resources.

## 1.2 GEOGRAPHIC RESPONSE PLAN DEVELOPMENT PROCESS

GRPs are part of the [Northwest Area Contingency Plan](#), revised and distributed separately. They've been developed for the marine and inland waters of Washington, Oregon, and Idaho. The plans are prepared through the efforts of, and in cooperation with, Washington Department of Ecology, Oregon Department of Environmental Quality, Idaho State Emergency Response Commission, U.S. Coast Guard, U.S. Environmental Protection Agency, as well as other state and federal agencies, tribal and local governments, response organizations, emergency responders, and communities. GRPs are developed through workshops and meetings with representatives of these organizations, as well as local oil spill emergency response experts, industry, environmental and conservation organizations,

ports, and pilots, among others. Participants identify resources that may be at risk of injury from spills and attempt to develop oil spill response or notification strategies to reduce the chance of injury to those resources.

After compiling information on sensitive resources in the area, site visits are conducted to gather data and determine if spill response strategies near those resources should be added, modified, or deleted. In this, the anticipated effectiveness of existing strategies are reviewed, modifications made as determine necessary, potentially unsafe or ineffective strategies removed, and new strategies added to the plan. Unfortunately, the dynamics of marine and inland water environments and the present limitations of response technology make the development of strategies for all resource locations impracticable. A draft plan is produced after site visits are completed, and made available for public review and comment before a final version of the GRP is produced and published. A responsiveness summary is also published that addresses public comments received during the GRP update process.

### **1.3 STANDARDIZED RESPONSE LANGUAGE**

In order to avoid confusion in response terminology, this plan uses standard National Interagency Incident Management System, Incident Command System (NIIMS ICS) terminology.

### **1.4 TERMINOLOGY AND DEFINITIONS**

The glossary provided in Section 1910 of the [NWACP](#) and other sections of the area plan with glossaries independent of Section 1910 should be used when seeking the meaning of terms used in this plan.

**This page was intentionally left blank.**

*Washington State Department of Ecology*

Spill Prevention, Preparedness, and Response (GRPs)  
P.O. Box 47600  
Olympia, WA 98504-7600

The form on the following page of this attachment can be used to submit comments by mail. Contact information is requested so that we can give you a call if more information or comment clarification is needed.

Please use the GRP Field Report Form for providing information on GRP strategy field visits or the testing of response strategies. The form is available online at <http://www.ecy.wa.gov/programs/spills/preparedness/GRP/Form-GRPFieldReport.pdf>. Additional information on Geographic Response Plans is available at <http://www.rrt10nwac.com/GRP>.

## CHAPTER 2

### Site Description

#### 2.1 CHAPTER INTRODUCTION

This chapter provides a description of the physical features, hydrology, climate, and winds, found along the Middle Columbia River (MCR) corridor and includes an overview of the oil spill risks in the region. The Columbia River travels 1,243 miles, originating in British Columbia, Canada and running through Washington, providing a border between Washington and Oregon before eventually entering the Pacific Ocean. Although the Columbia River originates in Canada, the NOAA river mile system used in these GRPs begins at the confluence of the river with the Pacific. The Lower Columbia River Geographic Response Plan (LCR-GRP) starts at river mile one and ends at the base of the U.S. Army Corps of Engineers (USACE) Bonneville Lock and Dam located at river mile 145.4. The Middle Columbia Region begins at river mile 145.4 on the upstream side of the Bonneville Lock and Dam and is subdivided into four separate GRPs, each a specific pool created by one of four USACE dams in the region: Bonneville, The Dalles, John Day, and McNary.

**The MCRJ-GRP encompasses the John Day Pool** (a.k.a. Lake Umatilla), and covers a 76 mile reach of the Columbia River, stretching east from the upstream side of the John Day Lock and Dam (located at river mile J-216.4 ) to the McNary Dam (located at river mile M-292.5). The John Day Pool borders Klickitat and Benton counties in Washington, and four counties in Oregon: Sherman, Gilliam, Morrow, and Umatilla.

#### 2.2 PHYSICAL FEATURES

Volcanic activity built up a stratum of mud, ash, and lava in the geologic column in the area now known as eastern and central Washington and Oregon during the Eocene (55.8-33.9 million years ago), Oligocene (33.9-23 million years ago), and Miocene (23-5.3 million years ago) Epochs.<sup>1 2</sup> Basalt flows then covered the area in layers, forming a strong foundation of basaltic rock. Subsequent lava and ash eruptions raised the Cascade Mountains during the Miocene Epoch, and the mountains began to lift when hundreds of volcanoes erupted during the Pleistocene Epoch (2.6 million – 11,700 years ago). As the mountains rose, the Columbia River carved out a deep gorge. Towards the end of the Pleistocene (~16,000-14,000 years ago) the Missoula floods battered the gorge over 100 times when the Missoula Lake was repeatedly breached, releasing high velocity debris-filled waters to a height of 900 feet and scouring the landscape with a discharge of 10 million cubic feet per second. This intense geomorphic action formed the sheer basalt cliffs that are now

<sup>1</sup> [http://www.columbiariverhighway.com/columbia\\_river\\_geologic\\_history.htm](http://www.columbiariverhighway.com/columbia_river_geologic_history.htm)

<sup>2</sup> <http://www.ucmp.berkeley.edu/cenozoic/cenozoic.php>

emblematic of the Columbia River Gorge National Scenic Area.<sup>3</sup> This series of events has been described as one of the greatest flood occurrences in the history of the earth.<sup>4</sup>

The nearly vertical cliffs of the Gorge are vulnerable to landslides, four of which occurred approximately 500 years ago, covering five square miles near Bonneville where they blocked the Columbia River and created a land bridge. The land bridge was located in the area of the current bridge known as “The Bridge of the Gods” and was perhaps the origin of the name, having been passed down through oral tradition. The dam formed by the land bridge created a lake of approximately the same size as the modern day Bonneville Pool, although within a few months the Columbia River breached this natural dam creating a flood 100 feet deep at Troutdale, OR. The Gorge is still susceptible to landslides; in 1984 two children were killed in a slide along Interstate 84 near Cascade Locks. In 1990 four highway workers were injured near Troutdale, and in 1996 a landslide in the Dodeson/Warrendale area of Oregon destroyed numerous homes, before sweeping across the railroad line and Interstate 84.<sup>5</sup> The features of this area continue to be shaped by landslides and the geomorphology of the Columbia River’s flow.

The river runs through the eastern plateau/steppe and then cuts through the Cascade and Coastal Mountain Ranges before entering the Pacific Ocean with much of the Middle Columbia located within the Columbia River Gorge National Scenic Area. As a result of the changing landscape, the climate surrounding the river changes drastically. The western side of the Gorge includes rainforests with an average annual rainfall of 75 inches. It is a place rich in wildlife, with forests, lakes, streams, wetlands, and more waterfalls than any other part of the country. The eastern Gorge has an annual rainfall of less than 15 inches, consists of a shrub steppe ecosystem, and is a place of rock bluffs and rolling hills used for farming and ranching.

Humans have also had an impact on the Columbia River. Archaeological evidence shows that nomads were staying in the Gorge over 14,500 years ago, and that settlements were established as early as 11,230 years ago.<sup>6</sup> Well before the establishment of white settlements, the Native people had developed the largest trading center in the Northwest at the Long Narrows of The Dalles/Celilo Falls area. Celilo is believed to be the oldest continuously inhabited community on the North American continent.<sup>7</sup> The center linked a trade network that extended along the entire Pacific Coast and inland to the Great Plains. Native people living on the Columbia River received a variety of trade goods from all across the region, much of it received in return for one of their most prized

resources — salmon. Salmon were central to the culture of the region's peoples, a part of their religious belief system, providing sustenance and trade goods.<sup>8</sup>

Europeans and Americans began exploring and trading in the Pacific NW in the late 18<sup>th</sup> and early 19<sup>th</sup> centuries. In 1792 Captain Robert Gray explored the lower river and named it for his ship, the *Columbia Rediva*.<sup>9</sup> In 1805 the Lewis and Clark Expedition traveled down the Snake and into the Columbia River, arriving at The Dalles/Celilo Falls area, which Clark noted as being a “great mart of trade”.<sup>10</sup> Within the next 50 years numerous white settlements were established along the river by people following the Oregon Trail or arriving by ship via the Pacific Ocean. The earliest treaties were negotiated with the region’s Native peoples in 1855, and by 1859 Oregon had become a state; Washington followed, with statehood granted in 1889. The first salmon cannery was established on the river in 1866. In 1873 the USACE began modifying the river to aid navigation by removing obstructions, and from 1876-1915 building canals.<sup>11</sup>

The USACE further shaped the Middle Columbia River into its current form through the construction of dams, beginning with the Bonneville Lock and Dam started in 1934 and completed in 1938, to the McNary Lock and Dam finished in 1957, The Dalles Lock and Dam finished in 1960, and the John Day Lock and Dam, completed in 1971.<sup>12</sup> The dams tamed the river’s once notorious rapids and created the sub-sectional pools of the area. Fish lost due to the creation of the dams were ensured by the Mitchell Act (1938) to be replenished by the creation of hatcheries. The dams inundated many of the Native American’s traditional fishing areas and in 1939, In-Lieu sites were promised to the affected Tribes to compensate for their losses.<sup>13</sup> The USACE began constructing In-Lieu sites in 1953 and as of the publishing of this document in 2015 there are 31 sites located in the area covered within the MCR.<sup>14</sup>

By taming the rapids, the dams allowed the river to function as an industrial transportation corridor, with ships running import containers and autos east from Portland, OR and Vancouver, WA through a series of locks up to the Tri-Cities area (Kennewick, Pasco, and Richland, WA), before continuing east via the Snake River to Lewiston, Idaho, where they eventually travel on to 43 states.<sup>15</sup> As of 2014, more than 4 million tons of petroleum products are received at terminals in Portland each year with approximately half of that volume barged upriver to inland ports.<sup>16</sup> The

<sup>16</sup> [http://graphics.thomsonreuters.com/F/12/US\\_CSFACT1210.pdf](http://graphics.thomsonreuters.com/F/12/US_CSFACT1210.pdf)

river corridor also provides a route for the transport of grain from farms in the interior of the county to the river's gateway at the Pacific Ocean. The Columbia River is the number one export route in the nation for wheat and barley, number two for soybeans, and the third largest grain export gateway in the world.<sup>17</sup>

The dams also provide irrigation and flood control, important to an area with substantial farmland (grains and livestock), as well as hydroelectric power to Oregon and Washington. In addition, the Columbia River Gorge, renowned for its stunning beauty and spectacular history, supports tourism in the area, providing a wealth of recreational opportunities such as hiking, fishing, mountain biking, windsurfing, and kayaking.

Within the MCR, each pool has its own unique attributes and communities. The John Day Pool is 76 miles long, has a capacity of 2,530,000 acres/feet.<sup>18</sup> This is the last west-east section of the river before the upstream course veers significantly north. The western half of the reservoir has very little development surrounding it, while the eastern half has a significant amount of farmland lining the river on both sides. Communities on the river include: Roosevelt, Paterson, and Plymouth, Washington as well as: Arlington, Boardman, Irrigon, Umatilla, and McNary, Oregon. Interstate-82 crosses the river toward between Plymouth and Umatilla connecting eastern Washington to eastern Oregon.

Despite the diverse change in scenery surrounding the river through each of its various pools, the shoreline habitats remain relatively consistent over the course of the MCR. They can be characterized as: exposed rocky headlands, wave-cut platforms, pocket beaches along exposed rocky shores, sand beaches, sand and gravel beaches, sand and cobble beaches, sheltered rocky shores, and sheltered marshes.<sup>19</sup>

## 2.3 HYDROLOGY

The Columbia River is the fourth largest river in North America and the largest in the Pacific Northwest. It originates in Columbia Lake, high in the Canadian Rockies, where it first travels northwest, and then turns south entering the US in Washington, where it eventually turns west and forms the border between Washington and Oregon before flowing into the Pacific Ocean.<sup>20</sup> The river travels a total of 1,243 miles, providing drainage for approximately 258,000 sq. miles of the Western United States and British Columbia, with numerous tributaries, both rivers and creeks, adding to the flow along the way.<sup>21</sup>

<sup>20</sup> [http://geonames.usgs.gov/apex/f?p=gnispq:3:0::NO::P3\\_FID:1140014](http://geonames.usgs.gov/apex/f?p=gnispq:3:0::NO::P3_FID:1140014)

<sup>21</sup> <http://pubs.usgs.gov/of/1987/ofr87-242/>

The flow of water in the MCR-GRP's 200 mile reach of the Columbia River is controlled by dam outflows within each pool. The John Day Pool has a normal elevation of 262 feet above mean sea level.<sup>22</sup> Tributary rivers within the John Day Pool include the John Day River (OR) and the Umatilla River (OR) basins. On the Washington side, creeks entering the reservoir are part of the Rock/Glade watershed, WRIA 31.<sup>23</sup> On the Oregon side, the John Day Pool is adjacent to the John Day and Umatilla watersheds.

## 2.4 CLIMATE AND WINDS

The West-East corridor of the Columbia Gorge through the Cascade mountain range creates a climate interaction between the Washington/Oregon coasts and the interior of the states. Due to the geologic formations and the atmospheric pressure imbalance surrounding this area, strong wind is frequently channeled through the Gorge year round. These conditions, in addition to the scenic surroundings, have made the Gorge a renowned sporting destination for windsurfing.<sup>24</sup> In the summer, the wind comes predominately from the west, while during the winter it will oscillate between east and west. This channeled Gorge wind is a conduit for air temperature in the surrounding regions as it funnels warm maritime air inland, and cold interior wind towards the coast.<sup>25</sup>

Western winds carrying moisture in the air from the Pacific are pushed up against the Coast Range, the Olympic Mountains, and finally the Cascade mountains, creating a phenomenon known as a rain shadow. A rain shadow is an area on the leeward side of the mountains which is sheltered from the rain, creating a distinct shift in climate.<sup>26</sup> As the air rises to pass over the mountains it expands and cools, releasing moisture in the form of precipitation on the western flanks. By the time these winds pass over the Cascades there is little moisture remaining, creating the shrub steppe ecosystem that is emblematic of Eastern Washington.

**The John Day Pool** lies just outside of the transition zone to the east of the mountains and has the dry continental climate common east of the Cascade Mountains. The mean annual temperature in Arlington, Oregon, elevation 280 feet above sea level, is 54° F, ranging from an average low of 34° F in January, to an average high of 76° F in July. Recorded temperature extremes include a low of -9° F and a high of 111° F. Mean annual precipitation is 9 inches with more than three quarters occurring between November and February. Annual snowfall is 8 inches, with more than half occurring in December and January.

<sup>26</sup> <http://usatoday30.usatoday.com/weather/tg/wrnshdw/wrnshdw.htm>

## 2.5 TIDES AND CURRENTS

There are no tidally influenced areas within the MCR area. The river's flow is governed strictly by the various dams, with the USACE determining exactly when and how much water is allowed to pass through the spillways; there are no free-flowing waters.

## 2.6 RISK ASSESSMENT

The Columbia River is one of the principal resources found in the Pacific Northwest with a plethora of natural, cultural, and economic resources intrinsically connected to the river, all at risk of injury from oil spills. Potential risks to these resources include large commercial vessels, pipelines, roads, rail systems, and other factors.

### Large Commercial Vessel Traffic

There is significant commercial movement through the Middle Columbia corridor which offers six separate port facilities, including the Ports of: Arlington, Hood River, The Dalles, Kennewick, Klickitat, and Skamania. The Dalles Lock reports “an average of 8 million tons of cargo, mostly grain and petroleum products, passing through each year.”<sup>27</sup> Future oil movement along the Columbia River Vessel Route is estimated to reach 566 million gallons/yr. (based on best annual estimates and 2013 data).<sup>28</sup> The potential for vessel collisions or groundings presents a significant spill risk. Large commercial vessels typically carry significant amounts of heavy and blended fuel oils and other petroleum products, increasing the risk for sensitive resources to be impacted if an oil spill incident were to occur.

### Road Systems

Vehicle traffic on roadways pose an oil spill risk in areas where they run adjacent to the shoreline, or cross over lakes, rivers, creeks, and ditches, that drain into the Columbia River. Several main highways run parallel to the river, including Highway 14 in Washington and Interstate-84 in Oregon. Within the MCR area there are six major highway bridges that cross the Columbia River, two that cross the Yakima River, and one that crosses the Snake River. In addition, there are approximately 30 smaller bridges or causeways where vehicles cross tributaries or small lakes on the shores of the Columbia. A vehicle spill onto one of these bridges or roadways can cause fuel or oil to flow from hardened surfaces into the Columbia River or its tributaries. Commercial trucks can contain hundreds to thousands of gallons of fuel and oil, especially fully loaded tank trucks, and may carry almost any kind of cargo, including hazardous waste or other material that would pose a risk to the environment. Smaller vehicle accidents pose a risk as well — commensurate to the volume of fuel and oil they carry.

<sup>27</sup> <http://www.nwp.usace.army.mil/Portals/24/docs/pubs/pamphlets/TDJDWCBrochure.pdf> pg. 3

<sup>28</sup> <https://fortress.wa.gov/ecy/publications/publications/1508010.pdf>

## Rail Transportation and Facilities

Similar to the highways systems that run along much of the Columbia River, rail transportation runs closely parallel to the river banks throughout the Lower and Middle Columbia River areas. BNSF Railroad's Fallbridge Subdivision runs along the Columbia River on the Washington side, while Union Pacific's Portland Subdivision runs along the opposing bank in Oregon. These two major railroad companies employ mixed cargo trains that can carry hazardous materials on both of these lines, including Bakken crude oil from the east to refineries along the coast.

The majority of the transportation of oil by rail into Washington and Oregon enters Washington at the border with Idaho near Spokane. Once in Washington, oil trains cross the Spokane River, travel to Pasco, and then continue westward along the Columbia River through the Columbia River Gorge to Portland, OR and Vancouver, WA. After reaching the coast, oil trains are heading north through Tacoma and Seattle, WA towards refineries in Anacortes and Ferndale, WA near the Canadian border.<sup>29</sup> Prior to 2012, there was little to no transport of crude oil by rail to Washington or Oregon, as oil was traditionally transported by water via tanker or barge.<sup>30</sup> With the surge in production at the North Dakota Bakken oil fields, and oil sands coming from Canada, rail has become an option for transporting crude to refineries throughout the country.

Locomotives by themselves typically hold several thousand gallons of diesel fuel plus large quantities of lube and motor oils. Individual tank cars can contain just over 30,000 gallons of crude oil or other petroleum products. Trains can carry 3,000,000 gallons of oil in a unit train of 100 tank cars; at 42 gallons per barrel that equates to 71,428 barrels. In 2013, approximately 17 million barrels were shipped through Washington, increasing to somewhere in the vicinity of 55 million barrels in 2014.<sup>31</sup> These numbers are only predicted to rise as facilities are improved or increased.<sup>32</sup>

The NuStar Energy facility in Vancouver, WA is planning on adding rail-offload capability and converting a 120,000 barrel methanol tank to store oil instead, allowing it to handle one crude-by-rail train approximately every three days.<sup>33</sup> Vancouver Energy is a facility proposed for the Port of Vancouver, which if approved, would initially handle one to two crude-by-rail trains per day, and would be capable of receiving up to four per day. When oil is transported by train it is usually carried by crude-by-rail unit trains, trains carrying 100 oil tank cars or more. Unit trains carrying

---

<sup>29</sup> <https://fortress.wa.gov/ecy/publications/publications/1508010.pdf> (320)

<sup>30</sup> Ecology data; rail data estimated based on refinery throughput data, ANT data, pipeline throughput for refineries, predicted volume transported by rail reported by refineries, and estimated increases in total crude transported through the state.

<sup>31</sup> <http://www.Statesmanjournal.com/story/news/2014/05/26/west-coast-oil-trains/9605759/>

<sup>32</sup> <https://fortress.wa.gov/ecy/publications/publications/1508010.pdf> (460)

<sup>33</sup> <https://fortress.wa.gov/ecy/publications/publications/1508010.pdf> (317)

crude oil are now commonly found travelling along the Columbia River. As of June 2014, nineteen loaded unit trains with Bakken oil were passing through the Middle Columbia River weekly.<sup>34</sup>

### **Oil Pipelines**

Two pipeline terminals are located in the MCR area. The Tidewater pipeline terminal and the Tesoro Logistics NW pipeline terminal are both situated in the McNary Pool, on the eastern shore of the Snake River near the its confluence with the Columbia in Pasco, Washington. These facilities receive, store and distribute bulk liquid products such as gasoline, diesel, bio-fuels, fertilizer, and industrial/agricultural chemicals.<sup>35</sup> Along with the pipelines, the facilities are accessible by barge, rail, and truck. A spill from a pipeline, or one of the other associated modes of transporting petroleum products, has the potential to significantly impact sensitive resources in the area.

### **Aircraft**

Several airports are located within the MCR area including the: Cascade Locks State Airport, Columbia Gorge Airport, Arlington Municipal Airport, and Tri-Cities Airport. Landing strips at these airports are used for recreational, commercial, and transit purposes. With airports in the area, the potential exists for aircraft failures during inbound or outbound flights that could result in a spill with a release of jet fuel to the Columbia River or its tributaries.

### **Recreational Boating**

Accidents involving recreational water craft on the Columbia River have the potential to result in spills of anywhere from a few gallons of gasoline, up to hundreds of gallons of diesel fuel. Examples of such accidents include: collisions, a vessel grounding, catching on fire, sinking, or exploding. These types of accidents, as well as problems with bilge discharges and refueling operations, the most typical types of spills to occur, have a negative impact on sensitive river resources.

### **Landslides, Earthquakes, Weather and Wildfire**

Oil spill risk factors include accidents near waterways due to natural events, including landslides, earthquakes, weather and wildfire. Landslides commonly occur on slopes and in areas where they have taken place before, and historically, the Columbia River Gorge is one of the areas that have been most active in the recent past.<sup>36</sup> A U.S. Geological Survey study (Blakely et al., 2011) presented geologic and paleoseismic evidence that the potential for large magnitude earthquakes (greater than M 7) could be much greater for eastern Washington than previously

<sup>36</sup> [http://mil.wa.gov/uploads/pdf/HAZ%20MIT%20PLAN/Landslide\\_Hazard\\_Profile.pdf](http://mil.wa.gov/uploads/pdf/HAZ%20MIT%20PLAN/Landslide_Hazard_Profile.pdf) (4)

assumed.<sup>37</sup> The MCR has its fair share of severe weather with the possibility of strong winds all year long, snow and ice in the winter, heavy rains in the western side of the Gorge, and thunderstorms throughout the area, which also place the region at risk of weather related wildfire.

### Other Spill Risks

Other potential oil spill risks in the area include: dam turbine mechanical failures, road run-off during rain events, on-shore or near shore construction activities where heavy equipment is being operated, and the migration of spilled oil through soil on lands adjacent to the river or along creek or stream banks, as well as security concerns, such as acts of vandalism, sabotage, or terrorism to dams, railroads, or pipelines.

**Note 1:** Collection for Skimming Operations response options should include use of enhanced skimming using a U-boom, V – boom, or J – boom configuration in waters large enough for boats to maneuver (e.g., lake, large river).

**Note 2:** Vessel Based Skimming Operations response options should include use of advancing skimmers: weir, belt, brush, drum, or other skimmer types.

**Note 3:** Shore Based Skimming Operations response options should include use of fixed skimmers: weir, belt, brush, drum, or other skimmer types.

**Note 4:** Shoreline Protection should include the deployment of response strategies (boom) to divert and collect oil off of the water before shoreline areas are impacted, or deflect and exclude oil away from shoreline areas. These strategies include those published in this document (GRP response strategies), those provided in other plans (e.g., facility contingency plans), and “ad-hoc” strategies developed during the spill itself. A culvert block or underflow dam might be installed to aid in the recovery of spilled oil in small streams or those with intermittent flow.

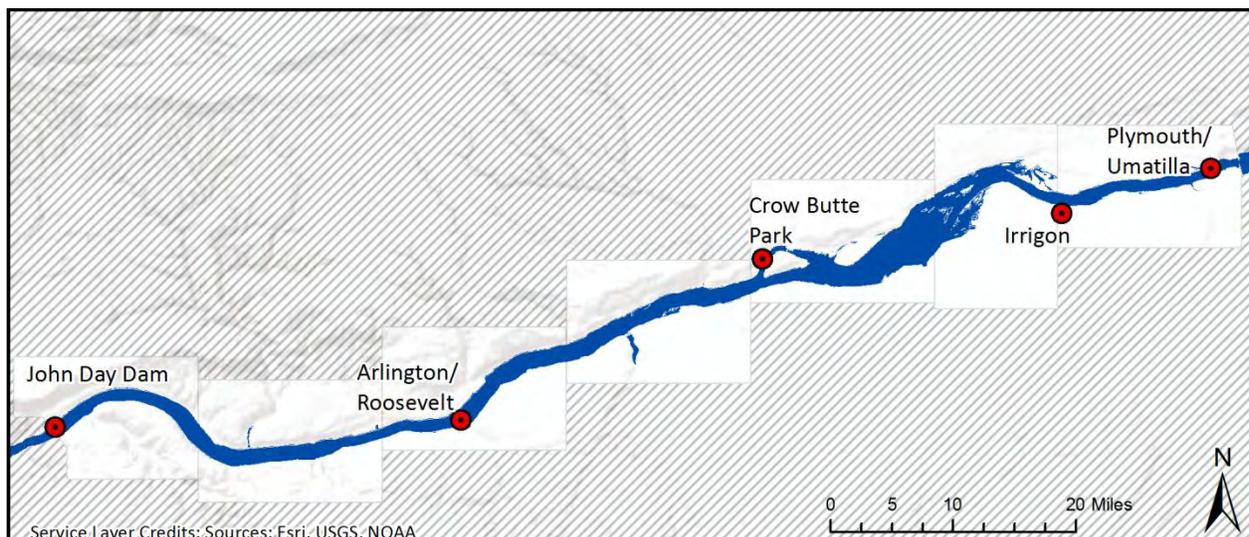

**Note 5:** Shoreside Cleanup options depend on safe and efficient access to locations and the type of river, creek, or stream bank present. Potential activities could include flooding, flushing, manual removal, vacuum, mechanical removal, sorbents, vegetation cutting, mechanical tilling/aeration, and/or sediment reworking/surf washing.

**Note 6:** More information available in Chapter 6. Response and cleanup in these areas may require coordination with Federal or State Fish and Wildlife staff to reduce disturbances to upland species.

**Note 7:** This sheet doesn’t represent all locations where Tribes and Tribal Nations have lands or areas of specific interest (including lands established by treaty or rights to Usual and Accustom areas). Early coordination with tribal governments is highly recommended during a response, regardless of the spill location or potential impact areas.

**Note 8:** These areas are not pre-approved for the use of in-situ burning. Refer to the Northwest Area Contingency Plan for the dispersant Policy.

**Note 9:** These areas are not pre-approved for the use of dispersants. Refer to the Northwest Area Contingency Plan for the dispersant Policy.

#### **CHAPTER 4**

### **Response Strategies and Priorities**

**OCTOBER 2015**

## Before you print this document

This chapter and its appendices, as well as the appendix at the end of Chapter 6, are provided in “landscape” page orientation. The detailed 2-page information sheets for each pool’s response strategies, notification strategies, staging areas, and boat launch locations in appendices 4A through 4D ([103-326](#)) have been designed for duplex printing (front and back side of paper), “open to top” configuration.

## 4.1 CHAPTER INTRODUCTION

This chapter provides information on GRP response strategies and the order (priority) they should be implemented, based on potential oil spill origin points (POSOPs) and their proximity to sensitive resources. Area maps, sector maps, and information on staging areas and boat launch locations are also provided in this chapter. During a spill incident, GRP response strategies should be implemented as soon as possible. Unless circumstances unique to a particular spill situation dictate otherwise, the priority tables in Section 4.3 should be used to decide the order that GRP strategies are deployed. The downstream movement of oil and the time it takes to mobilize response resources to deploy GRP strategies must always be considered when setting implementation priorities. Information on resources at risk, sensitive areas, and flight restrictions can be found in Chapter 6 of this plan. Information on protection techniques can be found in Appendix A. Information on shoreline countermeasures can be found in the Northwest Area Shoreline Countermeasures Manual (NWACP Section 9420). The Northwest Area Contingency Plan (NWACP) is available online at <http://www.rrt10nwac.com/NWACP/Default.aspx>.

The GRP strategies provided in this chapter have been created to reduce spilled oil's impact on sensitive resources. They are not everything that should or could be done during a response to lessen the chance of injury to natural, cultural, and economic resources at risk from oil spills. Although designed to be implemented during the initial phase of an oil spill, GRP strategies may continue to be used throughout a response at the discretion of the Incident Commander or Unified Command.

### 4.1.1 On-site Considerations

#### *Before Deploying a GRP Strategy (Questions to Ask)*

- Are conditions safe? Response managers and responders must first determine if efforts to implement a response strategy would pose an undue risk to worker safety or the public, based on conditions present during the time of the emergency. No strategy should be implemented if doing so would threaten public safety or present an unreasonable risk to the safety of responders.
- Has initial control and containment been sufficiently achieved? Source control and containment of the spill at or near the source of a spill are always higher priorities than the deployment of GRP response strategies, especially when concurrent response activities are not possible.
- How far downstream or out into the river environment is the spilled oil likely to travel before response personnel will be ready and able to deploy GRP response strategies?
- Are permits required? Consult the Northwest Area Contingency Plan Permit Summary Table ([NWACP Section 9401](#)) for information specific to your location and circumstance.

- Will equipment or vehicles need to be staged on or near a roadway? If so, traffic control may be required. Contact the Washington State Patrol, the Oregon State Police, or local, county, municipality, or tribal police for assistance. At minimum, [Washington Department of Transportation \(WADOT\) guidelines](#) for work zone traffic control should be followed when working on or near a roadway.
  - Washington State Patrol District #3 (509) 575-2320
  - Washington State Patrol District #5 (360) 449-7909
  - Oregon State Patrol, The Dalles Area (541) 296-9646
  - See Local Government Contact Sheets [Spill Response Contact Sheet1](#)

### ***During Strategy Implementation (Things to Remember)***

- On-scene conditions (weather, currents, tides, waves, river speed, and debris) may require that strategies be modified in order to be effective. There is a significant chance that weather and conditions experienced at a particular strategy location during an actual spill event will be different from that when data was gathered during field visits. Response managers and responders must remain flexible and modify the strategies provided in this chapter as needed to meet the challenges experienced during an actual response.
- Certain strategies may call for access points or staging areas that are not easily reached at all times of the year or in all conditions.
- Oil containment boom must be free of twists, gaps, and debris in order to remain effective.
- The GRP response strategies provided in this chapter were designed for use with persistent heavy oils that float on water and may not be suitable for other petroleum products or hazardous substances.

### ***After Strategy Implementation (Things to Understand)***

- Oil containment boom should be maintained and periodically monitored to ensure its effectiveness. Changes in river or current speed will likely require modifications to boom deflection angles (see Table 4.1). Depending on conditions, some booming strategies may require around-the-clock tending.
- Although designed for implementation during the initial phase of an oil spill, GRP strategies may continue to be deployed and implemented throughout the entire lifespan of a response, as determined appropriate and necessary by the Incident Commander or Unified Command.

### ***Water Speed and Boom Deflection Angle***

Measure the speed that water is moving by anchoring a line with two floating markers/buoys attached that are spaced 100 feet apart. Time the movement of floating debris between the two buoys, and then use Table 4.1 to estimate the water speed based on the travel time of the debris between the two buoys. You can also measure 100 feet along a straight portion of river bank or shoreline, and time the movement of debris between those points, but this method is generally less accurate than using the buoys. The maximum boom deflection angle is also provided in the table, based on the water speed measurements.

**Table 4-1: Water Speed Drift Measurement Table**

<b>Time to Drift 100 Feet (seconds)</b>	<b>Velocity (ft/sec)</b>	<b>Velocity (m/sec)</b>	<b>Velocity (knots)</b>	<b>Max Boom Deflection Angle (degrees)</b>	<b>Boom required for 100-foot Profile to Current (feet)</b>	<b>Anchors needed if Placed Every 50 feet (number)</b>

#### 4.1.2 Historical River Streamflow Ranges

Gage/stream-flow data from U.S. Geological Survey (USGS) was used to determine the mean monthly river discharge for the Columbia River and its tributaries. River discharge is recorded in cubic feet per second (cfs); velocities in miles per hour (mph). Table 4.1 provides information that can be used to calculate river velocities based on the time it takes a floating object to drift 100 feet downstream from any given point in a river or creek. Additional information on calculating river velocities can be found in the [Northwest Area Contingency Plan Section 9302](#). Information on USGS river gauge readings can be found online at <http://maps.waterdata.usgs.gov/mapper/index.html>.

**Table 4-2: Historical River Streamflow Ranges**

## 4.2 AREA OVERVIEW MAPS

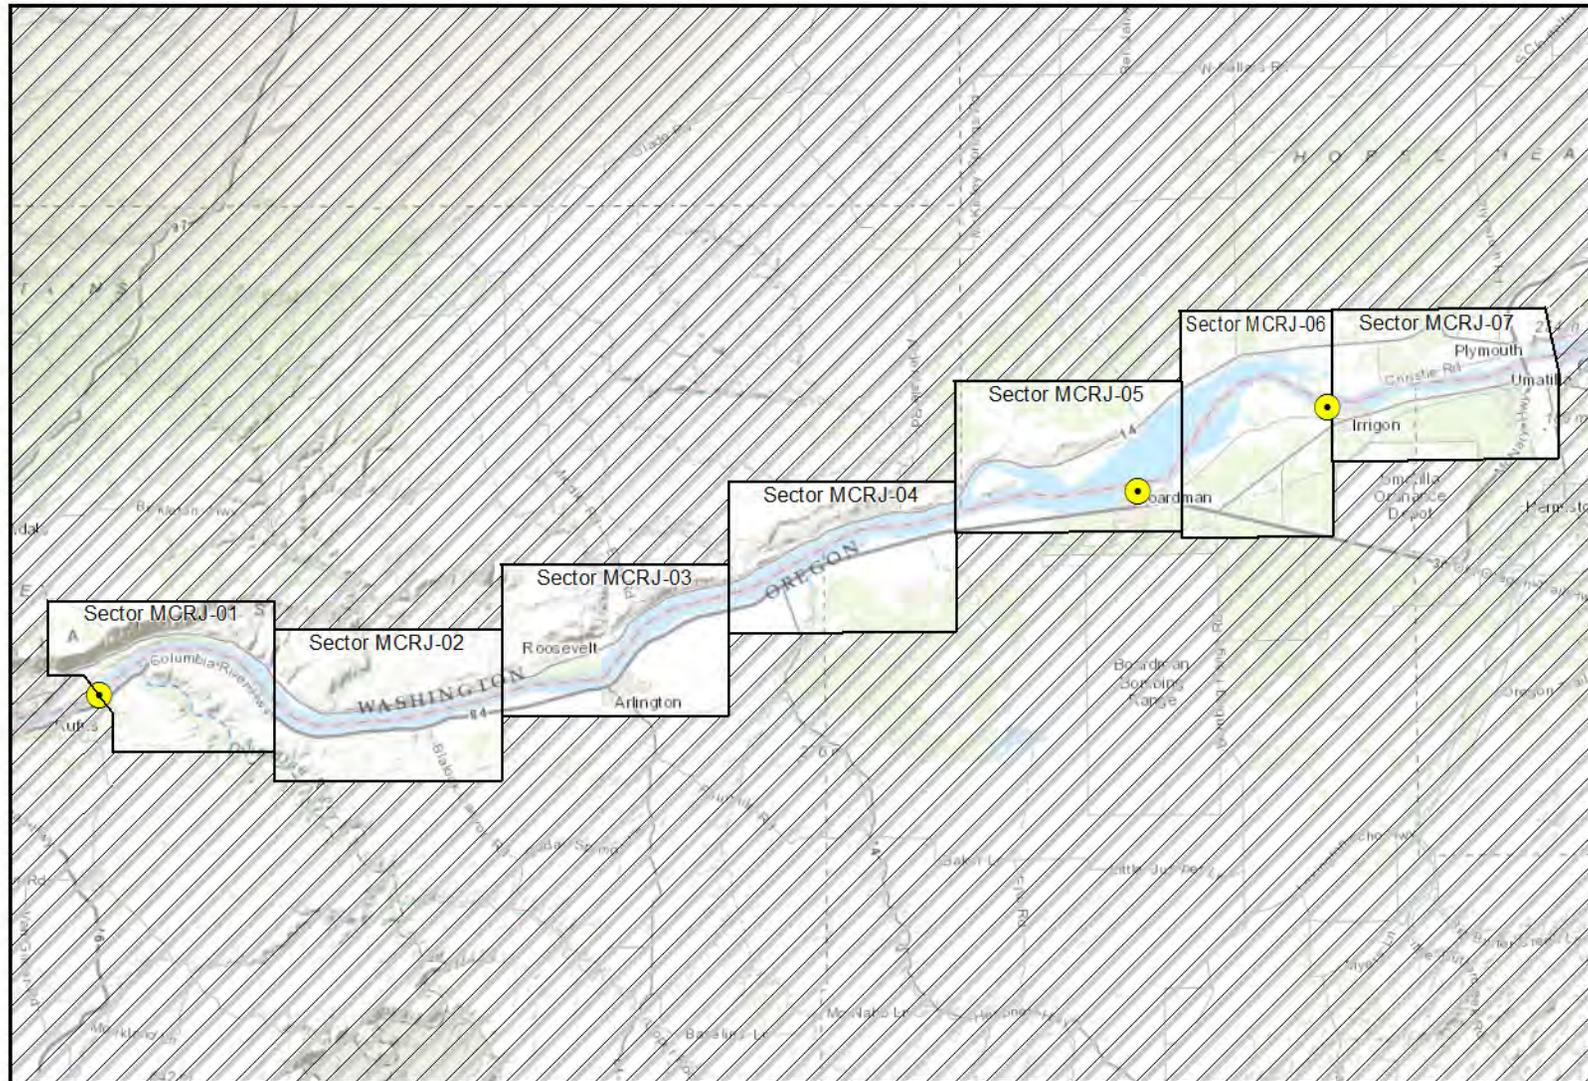

The following maps provide a geographic overview of the Middle Columbia River GRP area by pool. Sector maps in Section 4.4 of this chapter provide more detail on the location of response strategies, notification strategies, staging areas, boat launch locations, and POSOPs. Detailed information for each location can be found in the matrices of Section 4.5 or in the chapter appendices. Priority tables for potential oil spill origin points can be found in Section 4.3.2.

The following area maps are provided, by pool, for reference:

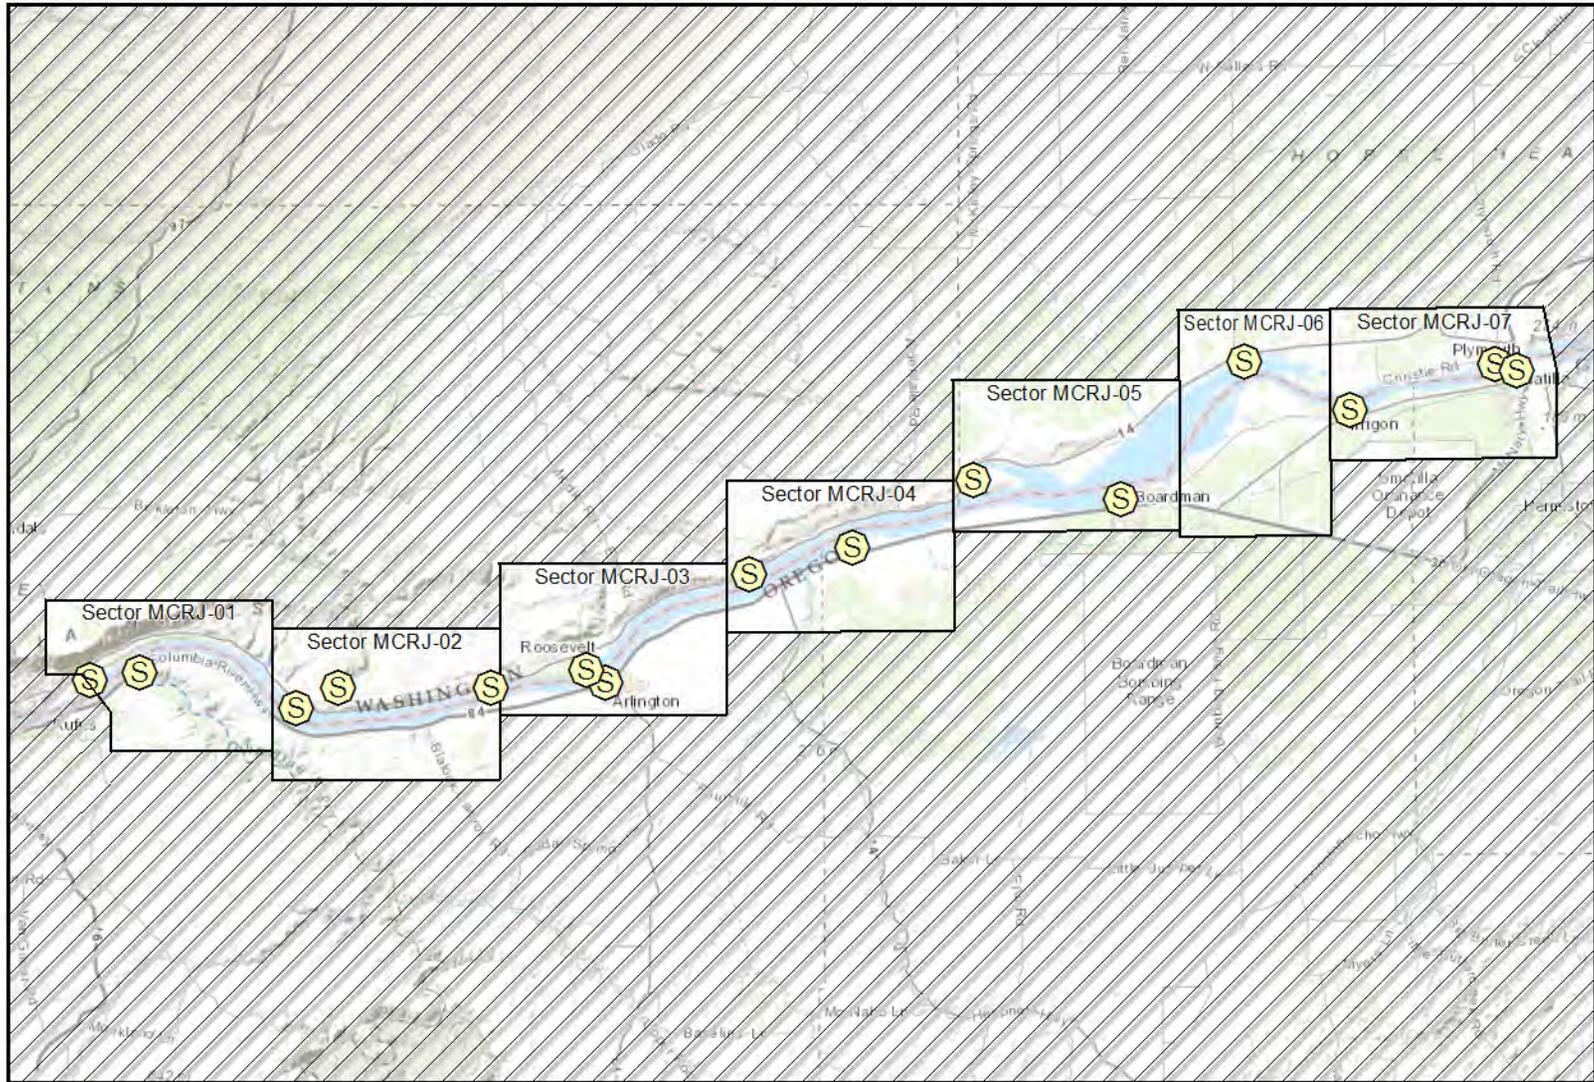

- Response Strategy Locations
- Notification Strategy Locations
- Staging Areas
- Boat Launch Locations
- Potential Oil Spill Origin Points

## 4.3 STRATEGY AND RESPONSE PRIORITIES

### 4.3.1 General Response Priorities

The following list provides the order of response priorities after an oil spill in the John Day Pool.

1. Safety is always the number one priority. Do not implement GRP strategies or take actions that will unduly jeopardize public, worker, or personal safety.
2. Notify local public health and safety personnel.
3. Control and contain the source of the spill; mobilize resources to the spill location. Source control and containment are always a higher priority than the implementation of GRP strategies.
4. Determine the priority or order GRP strategies should be implemented based on the location of the spill or affected area. Priorities based on POSOPs are included in this chapter and should be used unless the situation or circumstances dictate otherwise (see Section 4.3.2).
5. As response resources become available, implement the GRP Strategies in order of priority.
6. In Washington State, if strategy implementation reduces, interrupts, or diverts the flow of water in streams, including the installation of a culvert block or underflow dam, an Emergency HPA must be obtained from WDFW (24-hour pager: 360/534-8233).

### 4.3.2 Strategy Priorities based on Potential Oil Spill Origin Points

POSOPs are geographic locations that have a defined list of response strategy implementation priorities are provided in a table within Section 4.3. The placement of each POSOP is often based on spill risks in the area, including oil pipelines, railways, highways/roadways, tributaries, and vessel movements. Intersections of two or more of these risk locations typically represent a higher spill risk than any one individually, increasing the probability of an oil spill. Occasionally POSOPs are generalized to ensure implementation priorities are developed throughout an entire planning area.

These points are displayed on area overview and sector maps as red boxes. In establishing response priorities during a response, or selecting an appropriate POSOP, the downstream and/or tidal movement of spilled oil and the time it takes to mobilize and deploy response resources must be considered. Generally, GRP strategies should first be implemented downstream, well beyond the furthest

extent of the spill, with deployments continuing upstream towards the spill source and in some cases slightly beyond. PSOPs are alphabetically designated.

The following tables provide the strategy implementation order for Potential Oil Spill Origin Points in the John Day Pool-GRP; example include, points J-A, J-B, J-C and J-D. These priority tables were determined using a combination of variables, including: notification time, travel time for responders and equipment, average and seasonal flow rates, average winds, tides or currents, deployment time, proximity to the spill source, and other considerations.

***“Source control and containment are a higher priority than GRP strategy implementation”***

## 4.5 MATRICES

### 4.5.1 Naming Conventions (Short Names)

Each strategy, staging area, and boat launch location in this document has been given a unique “Short Name” which includes one to six letters denoting the associated waterbody. Following the letters are numbers that specify the location. On rivers or other linear waterbodies, the location is named by river mile: the distance from the mouth of the river or creek upstream to the site location. Some short names indicate whether the site is located on river right, river left, or mid-river by an “R”, “L” or “M” after the river mile. On lakes, the numbers indicate the location by shoreline mile, typically starting at the northernmost point and increasing clockwise around the lake. In marine areas, the numbers do not have a geographic meaning. Notification strategies are indicated by an “-N” at the end of the name. Staging Areas and Boat Launches are indicated by the prefix “SA” or “BL”.

Associated river body short name designations used within the Middle Columbia include:

B=Bonneville Pool  
 D=The Dalles Pool  
 J=John Day Pool  
 M=McNary Pool  
 MSN=McNary Pool/Snake River

SIH=Snake River/Ice Harbor Pool  
 WIND=Wind River  
 LDR=Lower Deschutes River  
 JDR=John Day River  
 RC=Rock Creek

WWR=Walla Walla River  
 YAK=Yakima River  
 N = Notification Strategy  
 SA = Staging Area  
 BL = Boat Launch

L = River Left  
 R = River Right  
 M = River Middle

**John Day Dam Fish Ladder NE** **J-216.5R**

**Position - Location:** 45° 43.163', -120° 41.780'      45° 43' 9.8", -120° 41' 46.8"      45.71938, -120.69634      Goldendale

**Strategy Objective:** Exclusion : Prevent oil from entering the fish ladder. If conditions are suitable collect oil with vac truck at this location.

**Implementation:** Angle 100' of boom on the upstream end of the fish ladder. Need to coordinate the anchor points with the John Day Dam. Vac truck access via Oregon side of the dam.

**Staging Area:** Onsite: Can stage some equipment on site, additional staging available at SA-J-216.5R/Railroad Island Park.

**Site Safety:** Slips, Trips, Falls, Water Hazard, John Day Dam

**Field Notes:** Launch at BL-J-216.5R/Railroad Island Boat Launch. Contact John Day Dam control room 541-298-9712 before accessing the dam

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Fish Ladder(s)

**Recommended Equipment**

2	Each	Anchoring System(s)- Shoreside
100	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Workboat(s) - of adequate size for type and amount of boom

## Nearest Address

John Day Dam Road  
 Goldendale, WA 98620

## Driving Directions

1. Directions to John Day Dam on the WA side. Starting at the intersection of WA Hwy97 & WA Hwy-14, head east on WA-14 E toward Stonehenge Dr (6.9 mi)
2. Turn right onto John Day Dam Rd (2.0 mi)
3. Turn Right for the dam access gate OR left toward Railroad Island boat launch (0.3 mi)

# John Day Dam Locks J-216.55R

**Position - Location:** 45° 43.194', -120° 41.764'      45° 43' 11.6", -120° 41' 45.8"      45.71990, -120.69606      Goldendale

**Strategy Objective:** Collection : Collect oil within the lock

**Implementation:** Deploy 500' of boom (BM-1) from the N lock wall out toward the NE to divert oil moving downstream into the lock for collection. Deploy 500' of boom (BM-1) across the lock walls to keep oil from exiting the lock if the spill source is within, collect from the N lock wall. Coordinate with USACE staff on anchor points.

**Staging Area:** Onsite: Can stage some equipment onsite with dam access, otherwise use SA-J-216.5/Railroad Island Park

**Site Safety:** Slips, Trips, Falls, Water Hazard, heavy equipment, John Day Dam

**Field Notes:** Must pre-notify the John Day Dam control room 541-298-9712 for access to the dam

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Lock and Dam

## Driving Directions

Directions to the John Day Dam on the Oregon Side.

1. Start at Boardman, Oregon
2. Go west on Boardman Ave NE toward Boardman Ave/N Main St (0.05 miles)
3. Turn left on N Main St (0.08 miles)
4. Turn right onto ramp and go on I-84 W/US-30 W (53.91 miles)
5. At exit 109 take ramp on the right to John Day Dam toward Rufus (0.3 miles)
6. Turn right (0.09 miles)
7. Bear right on John Day Dm (John Day Dam Ln) (0.07 miles)
8. Continue along John Day Dam Road up to the Dam.

**Entrance to Lake Umatilla** **J-217.1R**

**Position - Location:** 45° 43.564', -120° 41.415'      45° 43' 33.8", -120° 41' 24.9"      45.72606, -120.69026      Goldendale

**Strategy Objective:** Exclusion : Keep oil out of inlet that leads to impounded Lake Umatilla.

**Implementation:** Use 100' anchored to the NE side of the tunnel and run it out to the SW to anchor off-shore, thereby keeping the tunnel open for boat access. Block off inlet only if necessary as it allow use of the Railroad Island boat launch. Adjust quantity and placement of anchors based on conditions of the day.

**Staging Area:** Remote: Stage at SA-J-216.5/Railroad Island

**Site Safety:** Steep Bank, Slips, Trips, Falls, Water Hazard, & Active Railroad, expect trains on the track at any time/from either direction. Do not allow

2. Go north on S Plymouth Rd toward SE 3rd Ave (0.63 miles)
3. Turn left on WA-14 (55.04 miles)
4. Turn left onto gravel road located at 45.707761 N, -120.392327 W, cross the tracks and stay left at the fork. Finish at 11011 Washington Hwy 14, 99356.

**Blalock Port Road** **J-234.1L**

**Position - Location:** 45° 41.794', -120° 22.244'      45° 41' 47.6", -120° 22' 14.6"      45.69657, -120.37074      Arlington

**Strategy Objective:** Collection : Collection

**Implementation:** Anchor 900' of boom to the NW side of the causeway and tow boom out to the NE to anchor off shore (trying to funnel oil into the impounded pond). Adjust angle of boom, quantity and placement of anchors according to conditions of the day. Anchor an additional 100' of boom inside the impounded pond at the SE corner of the causeway, tow it to the SW and anchor it on shore to divert oil to the collection point at the boat ramp.

**Staging Area:** Onsite: 350' x 50' Gravel staging area at primitive boat launch

**Site Safety:** Steep Bank by causeway, Slips, Trips, Falls, Water Hazard, & Active Railroad, expect trains on the track at any time/from either direction

**Field Notes:** Launch on site at primitive boat ramp. Ramp has been silted up, so care must be taken when launching.

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Downstream Resources

**Recommended Equipment**

5	Each	Anchor - Danforth (or other appropriate type)
3	Each	Anchoring System(s)- Shoreside
1000	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Vac Truck or Skimmer and Storage
1	Each	Workboat(s) - of adequate size for type and amount of boom

**Recommended Personnel**

1	Boat Operator
4	Laborer

5. Continue straight, destination will be on the right just past the marina (341 ft)

## Crow Butte -Highway 14 MP 155.5 J-264.6R

**Position - Location:** 45° 51.958', -119° 49.040'      45° 51' 57.5", -119° 49' 2.4"      45.86596, -119.81733      Prosser

**Strategy Objective:** Deflection : Prevent oil from entering valuable bird habitat, mashland near Crow Butte bridge.

**Implementation:** Use 900' of boom. Will need waders and machetes. There is not a strong influx of water in this area from the main channel. Onlly deploy if oil is observed or forcast to enter the area. Adjust quantity and placement of anchors based on conditions of the day.

**Staging Area:** Remote: Crow Butte Park (SA-J-262.7R)

**Site Safety:** Slips, Trips, Falls, Water Hazard, Shallow Water

**Field Notes:** Launch boat from Crow Butte Park (BL-J-262.7R)

**Watercourse:** Freshwater Wetland - John Day Pool

**Resources at Risk:** Resident Fish, Salmon Concentrations and Habitat, Sensitive Nesting Species, Waterfowl and Shorebird Concentrations, Wildlife Refuge

### Recommended Equipment

1	Each	Anchor - Danforth (or other appropriate type)
2	Each	Anchoring System(s)- Shoreside
900	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Machete(s) - (or other vegetation cutting tool)
1	Each	Workboat(s) - of adequate size for type and amount of boom

### Recommended Personnel

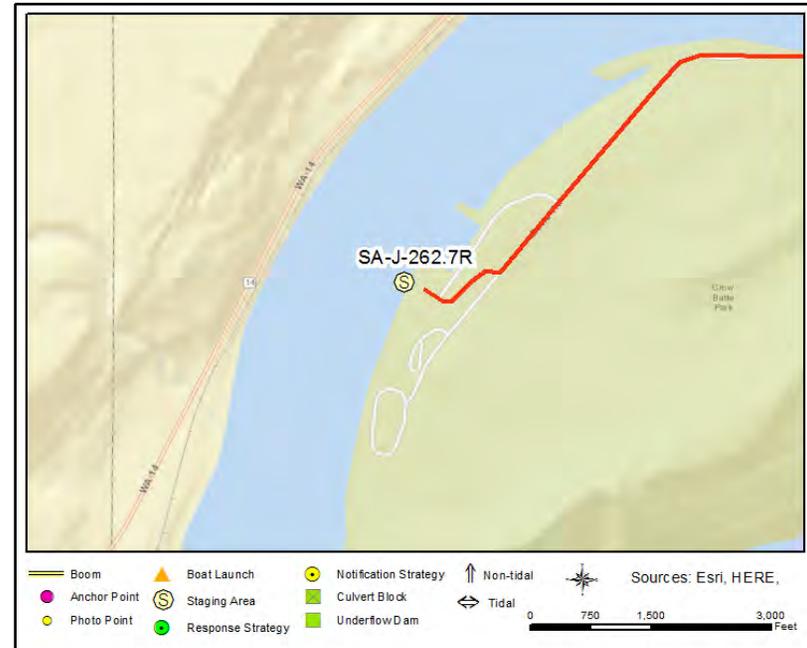

1	Boat Operator
3	Laborer

Directions to Crow Butte boat launch from I-82 South.

1. From I-82 South take exit 131 and head west on WA-14 W toward Plymouth Rd (25.7 mi)
2. Turn right onto Sonova Rd )51 ft
3. Take the 1st right onto W Crow Butte Rd (1.7 mi)
4. Turn right (0.2 mi)
5. Continue straight, destination will be on the right just past the marina (341 ft)

## Crow Butte Water Intake J-264.8R

**Position - Location:** 45° 51.885', -119° 48.352'      45° 51' 53.1", -119° 48' 21.1"      45.86474, -119.80587      Prosser

**Strategy Objective:** Exclusion : Keep oil out of water intake facility.

**Implementation:** Use 200' off boom in a chevron configuration to deflect oil away from the intakes. Adjust angle of boom, placement & number of anchors according to conditions of the day.

**Staging Area:** Onsite: Can stage some equipment on site or at Crow Butte Park (SA-J-262.7R)

**Site Safety:** Shallow Water, Slips, Trips, Falls, Water Hazard, & Active Railroad, expect trains on the track at any time/from either direction. Do not

**Field Notes:** Launch boat from Crow Butte Park (BL-J-262.7R)

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Water Intakes

### Recommended Equipment

1	Each	Anchor - Danforth (or other appropriate type)
2	Each	Anchoring System(s)- Shoreside
200	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Workboat(s) - of adequate size for type and amount of boom

### Recommended Personnel

### Driving Directions

1. Start at U.S. Hwy 395, Pasco, WA
2. Go southeast on N 4th Ave (0.05 miles)
3. Turn right on W Sylvester St (0.09 miles)
4. Turn left on N 5th Ave (0.22 miles)
5. Turn right on W Clark St (0.5 miles)
6. Turn left on N 12th Ave (0.06 miles)
7. Make sharp right on W Lewis St (1.41 miles)
8. Take ramp and go on US-395 S (0.78 miles)
9. At fork keep left on US-395 (5.18 miles)
10. Take ramp on the left and go on I-82 E/US-395 S toward Pendleton/Umatilla (18.87 miles)
11. At exit 131 take ramp on the right to WA-14 W toward Plymouth/Vancouver (0.33 miles)
12. Turn right on WA-14 (23.82 miles)
13. Take a left on gravel road at 138469 WA-14, 99350
14. Cross the RR tracks and follow dirt road to the water intakes.

## Eastern end of Crow Butte Island J-265M

**Position - Location:** 45° 51.411', -119° 48.235'      45° 51' 24.7", -119° 48' 14.1"      45.85685, -119.80391      Patterson

**Strategy Objective:** Deflection : Prevent oil from entering valuable bird habitat, marshland near Crow Butte Bridge.

**Implementation:** Cascade 3 sections of 500' boom each to deflect oil away from the northside of Crow Island. Water does not appear to flow strongly through this area. Does not appear to be a collection point for debris. Adjust quantity and placement of anchors based on conditions of the day.

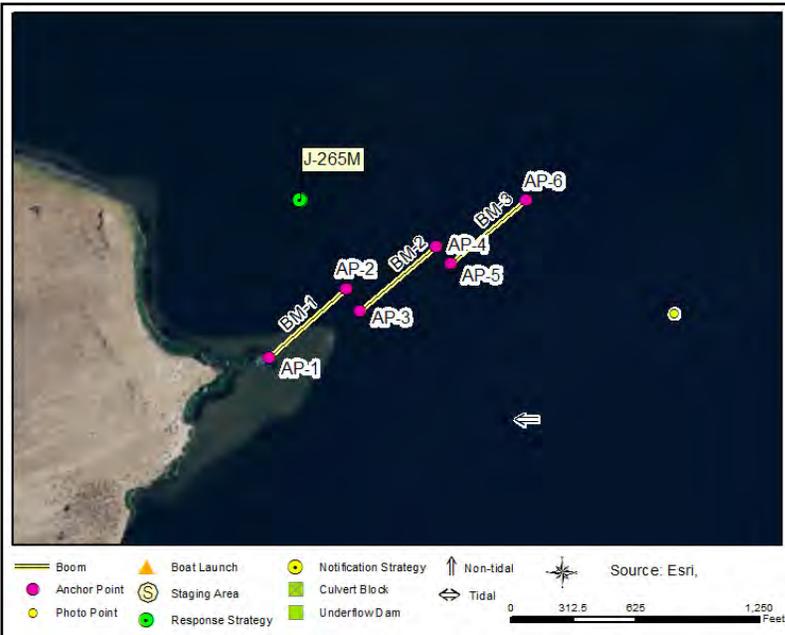

**Staging Area:** Remote: Stage at SA-J-262.7R/Crow Butte

**Site Safety:** Slips, Trips, Falls, Water Hazards, Shallow Water

**Field Notes:** Launch at BL-J-262.7R/Crow Butte

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Resident Fish, Salmon Concentrations and Habitat, Sensitive Nesting Species, Waterfowl and Shorebird Concentrations, Wildlife Refuge

### Recommended Equipment

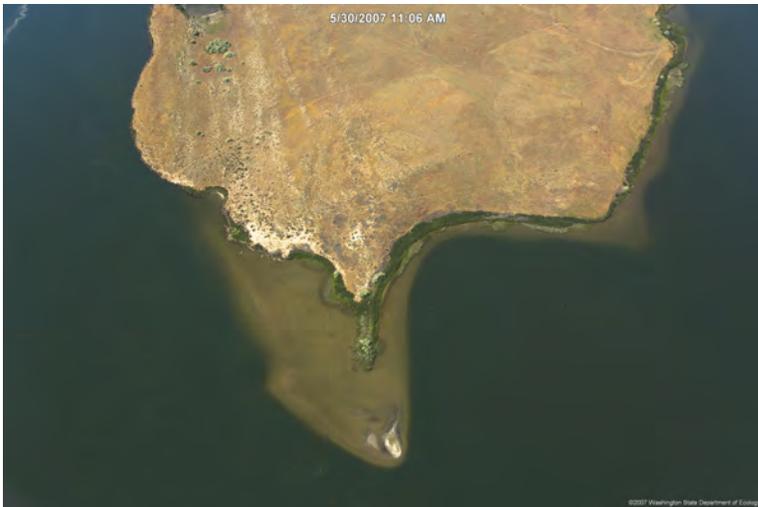

10	Each	Anchor - Danforth (or other appropriate type)
1	Each	Anchoring System(s)- Shoreside
1500	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Workboat(s) - of adequate size for type and amount of boom

2. Turn right onto Sonova Rd )51 ft
3. Take the 1st right onto W Crow Butte Rd (1.7 mi)
4. Turn right (0.2 mi)
5. Continue straight, destination will be on the right just past the marina (341 ft)

**Collection point NE of Crow Butte** **J-265.3R**

**Position - Location:** 45° 51.841', -119° 47.779'      45° 51' 50.4", -119° 47' 46.8"      45.86401, -119.79632      Prosser

**Strategy Objective:** Collection : Divert oil moving downstream to the collection point

**Implementation:** Deploy 1000' of boom from shoreside anchor point located at 45.864007 N, -119.796287 W; run boom out to the SE and anchor. Not a strong influx of water into this area from the main channel. Deploy only if oil is forecast to enter this area. Adjust angle of boom, placement and number of anchors, depending on conditions of the day.

**Staging Area:** Onsite: Must cross tracks and follow graded rd adjacent to tracks to staging area - use 4-wheel drive in bad weather

**Site Safety:** Railroad Crossing, Slips, Trips, Falls, Water Hazard, & Active Railroad, expect trains on the track at any time/from either direction. Do not

**Field Notes:** Launch from BL-J-262.7R/Crow Butte

**Watercourse:** River - Above a Dam - John Day pool

**Resources at Risk:** Downstream Resources, Waterfowl and Salmonid Concentrations and Habitat

**Recommended Equipment**

5	Each	Anchor - Danforth (or other appropriate type)
1	Each	Anchoring System(s)- Shoreside
1000	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Vac Truck or Skimmer and Storage

2. Go east on SE 3rd Ave toward S Plymouth Rd (0.02 miles)
3. Turn left on S Plymouth Rd (0.57 miles)
4. Turn left on WA-14 (23 miles)
5. Go past Canoe Ridge Rd (0.5 miles) and turn left by a parking lot to get to the railroad crossing
6. Turn right on the gravel road running adjacent to the tracks for (0.28 mi) then left at the fork. Your destination will be directly ahead.

## Whitcomb Shallow Water Habitat J-266R

**Position - Location:** 45° 51.757', -119° 46.857'      45° 51' 45.4", -119° 46' 51.4"      45.86262, -119.78094      Prosser

**Strategy Objective:** Exclusion : Keep oil out of shallow water habitat.

**Implementation:** Use 300' of boom deployed in a chevron configuration. Thick vegetation on shore, recommend taking a machete to help set shoreside anchors. Adjust quantity and placement of anchors based on conditions of the day.

**Staging Area:** Remote: Stage at SA-J-262.7R (Crow Butte Park)

**Site Safety:** Slips, Trips, Falls, Water Hazard, Shallow Water.

**Field Notes:** Launch at Crow Butte Park, BL-J-262.7R.

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Resident Fish, Salmon Concentrations and Habitat, Sensitive Nesting Species, Waterfowl and Shorebird Concentrations, Wildlife Refuge

### Recommended Equipment

1	Each	Anchor - Danforth (or other appropriate type)
2	Each	Anchoring System(s)- Shoreside
300	Feet	Boom - B2 (Contractor Boom) or equivalent
1	Each	Workboat(s) - of adequate size for type and amount of boom

## Whitcomb Island East End- High Water J-269.9R

**Position - Location:** 45° 52.639', -119° 42.930'      45° 52' 38.3", -119° 42' 55.8"      45.87732, -119.71550      Boardman

**Strategy Objective:** Exclusion : Keep oil out of Umatilla Wildlife Refuge, channel behind Whitcomb Island.

**Implementation:** Use 200' of boom in a chevron configuration. During site visit in 2014 water access into slough was not found. Possible it only needs to be deployed during high water situations. Need a machete to clear vegetation for shoreside anchors. Adjust quantity and placement of anchors based on conditions of the day.

**Staging Area:** Remote: Stage equipment at SA-J-269.5L, Boardman Marina

**Site Safety:** Slips, Trips, Falls, Water Hazard, Shallow Water

**Field Notes:** Launch Boat at BL-J-269.5L, Boardman Marina

**Watercourse:** River - Above a Dam - John Day Pool

**Highway 14, MP 161.5** **J-272.2R**

**Position - Location:** 45° 53.232', -119° 41.723'      45° 53' 13.9", -119° 41' 43.4"      45.88720, -119.69539      Prosser

**Strategy Objective:** Collection : Collect oil as it moves downriver.

**Implementation:** Use 1000' of boom to divert oil to the shoreline for collection. Access is through BNSF property. Access road may be too small for a vac truck. If road is too small for a vac truck consider altering strategy J-273.2R which is directly upriver to allow for collection. Adjust quantity and placement of anchors based on conditions of the day.

**Staging Area:** Onsite: Can stage some equipment on site, additional staging at Boardman Marine Park

**Site Safety:** Shallow Water, Slips, Trips, Falls, Water Hazard, & Active Railroad, expect trains on the track at any time/from either direction. Do not

1. Start at US 395, Kennewick, wa
2. Go southwest on I-82 (US-395 S) (9.65 miles)
3. At exit 131 take ramp on the right to WA-14 W toward Plymouth/Vancouver (0.33 miles)
4. Turn right on WA-14 (19.33 miles)
5. Turn left onto gravel road at 95200 Washington 14, 99350, and follow down to collection site at the river.

**Glade Creek** **J-273.2R**

**Position - Location:** 45° 53.556', -119° 41.469'      45° 53' 33.3", -119° 41' 28.1"      45.89259, -119.69115      Prosser

**Strategy Objective:** Exclusion : Keep oil out of creek mouth and marsh.

**Implementation:** Use 1000' of boom to deflect and exclude oil. Eastern anchor should be attached to the shoreline and run the boom to the pumphouse structure. Adjust quantity and placement of anchors based on conditions of the day.

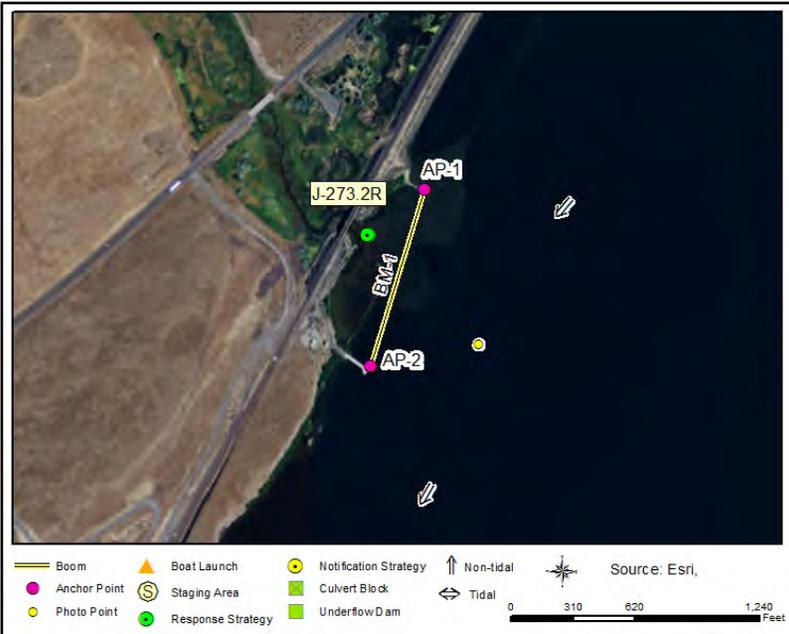

**Staging Area:** Onsite: Some staging available onsite, additional staging at Boardman Marina.

**Site Safety:** Shallow Water, Slips, Trips, Falls, Water Hazard, & Active Railroad, expect trains on the track at any time/from either direction. Do not

**Field Notes:** Launch boat from Boardman Marina (BL-J-269.5L)

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Waterfowl and Salmonid Concentrations and Habitat

**Recommended Equipment**

4	Each	Anchor - Danforth (or other appropriate type)
2	Each	Anchoring System(s)- Shoreside
1000	Each	Boom - B2 (Contractor Boom) or equivalent
1	Each	Workboat(s) - of adequate size for type and amount of boom

**Recommended Personnel**

1	Boat Operator
4	Laborer

11. Turn right on Quincy Ave (0.12 miles)
12. Finish at 1710 Quincy Avenue, 97882, on the left

# John Day Lock, downstream J-292.4R

**Position - Location:** 45° 56.388', -119° 18.179'      45° 56' 23.3", -119° 18' 10.8"      45.93980, -119.30299      Kennewick

**Strategy Objective:** Collection : Keep oil from moving downstream

**Implementation:** Deploy two sections of boom across the downstream section of the lock, a 100' section at the area where the lock starts to widen out, and the second, a 500' section of boom, should be deployed at the end of the lock. Both sections of boom should be set at an angle running from NE to SW so that oil can be collected at the SW corners. Adjust angle of boom, as well as quantity and placement of anchors based on conditions of the day. Use vac truck or skimmer with portable storage; additional pumps may be needed depending on water level.

**Staging Area:** Onsite: Contractors must call McNary Dam control at 541-922-2231 to access site.

**Site Safety:** Water hazard, heavy equipment, slips, trips & falls.

**Field Notes:** Launch from BL-J-290.8L/Port of Umatilla

**Watercourse:** River - Below a Dam - Site is at the downstream side of the McNary Dam in the lock, but considered to be in the John Day pool

**Resources at Risk:** Downstream Resources, Lock and Dam

## NOTIFICATION STRATEGIES - LIST

**J-216.5-N**

**J-270.1L-N**

**J-281.5L-N**

**M-292.6-N**

**M-309.4-N**

## John Day Lock & Dam Notification J-216.5-N

**Position - Location:** 45° 42.928', -120° 41.551'      45° 42' 55.7", -120° 41' 33.1"      45.71546, -120.69252      Rufus

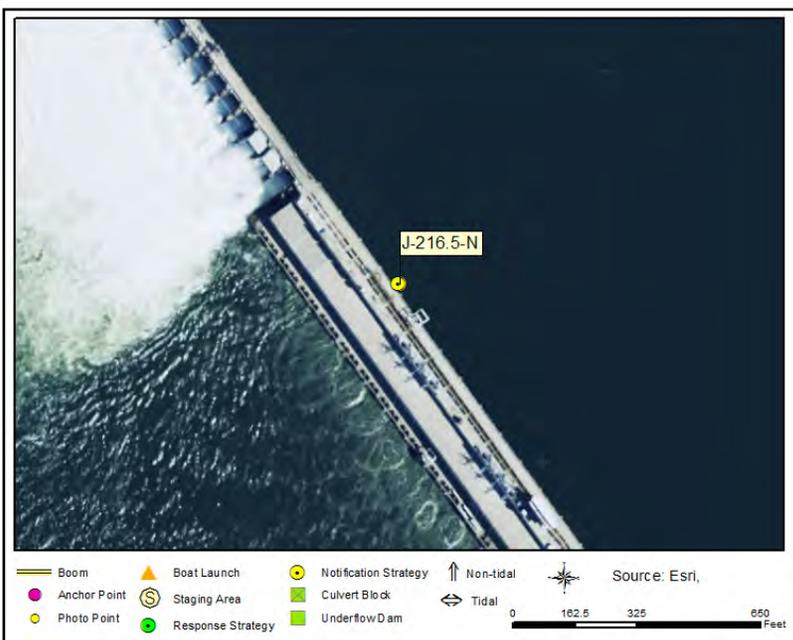

**Strategy Objective:** Notification : Protection of fish ladders, lock &/or spillway closure, deployment of GRP strategies

**Implementation:** Notify Project management and take action to protect USACE property and resources, including the deployment, by USACE staff or response contractors, of GRP strategies. Strategies in The John Day pool include: J-216.5R and J-216.7L, both exclusion strategies to protect the fish ladders on the upstream side of the dam, and J-216.55R, a collection strategy for the E end of the lock; strategies on the downstream side of the dam, in The Dalles pool, include: D-216.8L and D-216.4R to protect the fish ladders, as well as D-216.3R, a collection strategy at the end of the lock.

**Field Notes:** USACE has the facilities to establish an incident command post on site. Responders should work with USACE personnel to gain access to facility property and recreation areas after hours. Those deploying GRP strategies on USACE property will need to be escorted.

**Watercourse:** River - Above a Dam - John Day Pool

**Resources at Risk:** Lock and Dam

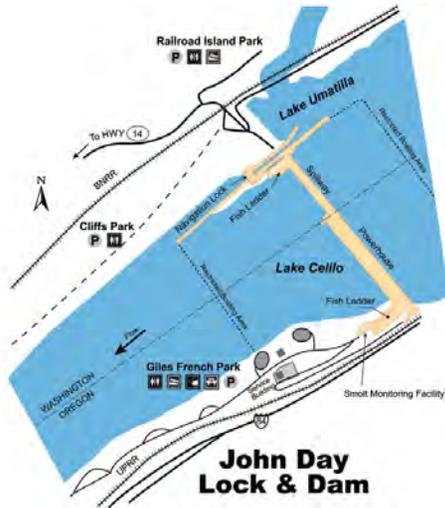

**Communication Process and Action:**

# CHAPTER 6

## Resources at Risk

### 6.1 CHAPTER INTRODUCTION

This chapter provides a summary of natural, cultural, and economic resources at risk in the Middle Columbia River area. It provides general information on habitat, fish, and wildlife resources, and locations in the area where sensitive natural resource concerns exist. It offers a summary of cultural resources that include fundamental procedures for the discovery of cultural artifacts and human skeletal remains. General information about flight restrictions, hazing, and oiled wildlife can be found near the end of this chapter. A list of economic resources in the area is provided in the chapter's appendix.

This chapter is purposely broad in scope and should not be considered comprehensive. Some of the sensitive resources provided in this chapter are listed because they could not be addressed in Chapter 4 (Response Strategies and Priorities). Additional information from private organizations or federal, state, tribal, and local government agencies should also be sought during spills and considered.

The information provided in this chapter can be used in:

- Assisting the Environmental Unit (EU) and Operations in developing additional response strategies beyond those found in Chapter 4.
- Providing resource-at-risk "context" to responders, clean-up workers, and others during the initial phase of a spill response in the GRP area.
- Briefing responders and incident command staff that may be unfamiliar with sensitive resource concerns in the GRP area.
- Providing background information for personnel involved in media presentations and public outreach during a spill incident.

### 6.2 NATURAL RESOURCES AT RISK - SUMMARY

Most biological communities are susceptible to the effects of oil spills. Plant communities on land, eelgrass and marsh grasses in estuaries, and kelp beds in the ocean; microscopic plants and animals; and larger animals, such as fish, amphibians and reptiles, birds, mammals, and a wide variety of invertebrates, are all at potentially at risk from smothering, acute toxicity, and/or the chronic long-term effects that may result from being exposed to spilled oil.

The Middle Columbia River subbasin affords a wide variety of aquatic, riparian, and upland habitats. These varied habitats support a complex diversity of wildlife species, including large and

small mammals, song birds, birds of prey, upland birds, and other waterfowl, as well as numerous reptiles and amphibians. Some species are resident throughout the year; others are migratory either within the subbasin or, in numerous cases, seasonally migrate outside the subbasin. Many wildlife species found in the subbasin are classified as threatened, endangered, sensitive, or of special concern under either the federal Endangered Species Act or Washington State guidelines. Classification types are listed below, with the abbreviation of each type provided in the brackets (to the right of the classification).

- Federal Endangered (FE)
- Federal Threatened (FT)
- Federal Candidate (FC)
- Federal Species of Concern (FCo)
- State Endangered (SE)
- State Threatened (ST)
- State Candidate (SC)
- State Monitored (SM)
- State Sensitive (SS)

**Sensitive species that may occur within this area, at some time of year, include the following federal and state listed species.**

***Birds:***

- American white pelican [SE],
- Bald eagle [SS (WA)],
- Burrowing owl [SC],
- Flammulated owl [SC],
- Golden eagle [SC (WA)],
- Greater sage-grouse [FC/ST],
- Lewis's woodpecker [SC],
- Loggerhead shrike [SC],
- Northern spotted owl [FT/SE (WA)/ST (OR)],
- Peregrine falcon [FCo/SS (WA)],
- Purple martin [SC (WA)],
- Sage thrasher [SC],
- White-headed woodpecker [SC],
- Yellow-billed cuckoo [FT/SC],
- Vaux's swift [SC (WA)].

***Mammals:***

- Black-tailed jackrabbit [SC],
- Canada lynx [FT/ST],
- Fisher [FC/SE],
- Gray wolf [FE/SE],
- Grizzly bear [FT/SE],
- Pygmy rabbit [FE/SE],
- Townsend's ground squirrel [SC],
- Washington ground squirrel [FC/SC (WA)/SE (OR)],
- Western gray squirrel [ST].

***Fish:***

- Bull trout [FT/SC (WA)],
- Columbia River chum salmon [FT/SC (WA)],
- Green sturgeon [FT],
- Lower Columbia River Chinook salmon [FT/SC (WA)],
- Lower Columbia River Coho salmon [FT/SE (OR)],
- Lower Columbia River steelhead [FT/SC (WA)],
- Mid-Columbia River steelhead [FT/SC (WA)],
- Pacific lamprey [FCo],
- River lamprey [FCo/SC],
- Snake River fall Chinook salmon [FT/SC (WA)/ST (OR)],
- Snake River sockeye [FE/SC (WA)],
- Snake River spring/summer Chinook [FT/SC (WA)/ST (OR)],
- Snake River steelhead [FT/SC (WA)],
- Upper Columbia River Chinook [FE/SC (WA)],
- Upper Columbia River steelhead [FT/SC (WA)].

***Amphibian and Reptile:***

- California mountain kingsnake [SC (WA)],
- Common sharp-tailed snake [SC],
- Larch Mountain salamander [SS (WA)],
- Oregon spotted frog [FT/SE (WA)],
- Sagebrush lizard [SC],
- Western (Pacific) pond turtle [SE (WA)],
- Western toad [SC (WA)].

**Plants:**

- Northern wormwood [FC],
- Ute ladies'-tresses [FT],
- White bark pine [FC],
- White Bluffs bladderpod [FT]

**6.2.1 General Resource Concerns****6.2.1a - Habitats:**

- **Wetlands** in this region are all fresh water and range from seasonal open marshes to forested swamps along rivers and streams. All wetland types support a diverse array of amphibian, bird, insect, fish, and wildlife species.
- **Riparian areas** serve as transitional zones between the uplands and the rivers and consequently are heavily used by a variety of wildlife. They also contribute to nearshore fish habitat by providing shade, cover, and food.
- **Side channels and impounded areas** provide feeding and resting areas for a variety of birds, including waterfowl and herons.
- **Islands** provide important nesting habitat for a variety of bird species, as well as habitat for a variety of mammals.
- **Stream mouths** are concentration areas for anadromous fish and are feeding areas for a variety of birds.
- **Human-made structures** such as pilings, rock jetties or log rafts may be used as roosting or nesting areas for a variety of marine birds and raptors.
- Numerous **habitat restoration sites** exist along the Middle Columbia River and its tributaries. Often, significant resources have been invested in these locations to improve stream conditions specific to salmon recovery.

**6.2.1b - Fish:**

- Various salmonids (both juvenile and adults) are present in the river above Bonneville Dam throughout the year. Millions of juvenile salmonids move downstream past the dam to use estuarine waters as a rearing and foraging area as they prepare for migration to the ocean. Returning adult salmonids of various types and stocks support significant tribal, commercial and recreational fisheries.
- Anadromous fish (other than salmon) in this region include American shad, Green sturgeon [FT], and Pacific lamprey [FCo].
- Resident fish present year-round in the river include White sturgeon, Walleye, Largemouth bass, Crappie, Perch, Bullheads and Northern pike minnow.

**6.2.1c - Wildlife:**

- Significant **waterfowl concentrations** exist throughout this GRP region from fall through spring. Hundreds of thousands of geese, swans, and dabbling ducks may occupy this region during peak periods. Resident and migratory waterfowl heavily utilize the islands, backwaters, wetlands and adjacent uplands of the region from fall through spring. Numerous islands in this sub-region also provide nesting habitat for resident waterfowl.
- **Bald eagles [ST] and Great blue herons** are nesting residents and may be found year-round throughout the region. Peregrine falcons [FCo/SS] are commonly found as winter and spring visitors. Other raptors, including Osprey, Northern harrier, and Burrowing owl [SC] are also regularly found in this area.
- **Resident and migratory songbirds** heavily utilize riparian habitats year-round and are susceptible to oiling if riparian vegetation and shorelines become contaminated.
- **Other small mammals** common to the region include beaver, muskrat, river otter, mink, and raccoon. The black-tailed jackrabbit [SC] and the Townsend's ground squirrel [SC] are also found in this area. Because of their habitat preferences, all of these species are vulnerable to contact with spilled oil.

### 6.2.2 Specific Geographic Areas of Concern

**Middle Columbia River, John Day Pool, Lake Umatilla (~RM 215-292).** See Figure 6-3.

1. **Railroad Island (~RM 216):** Waterfowl breeding and winter concentration areas. Salmonid concentration and rearing habitat. Public recreation area (Army Corp of Engineers Park).
2. **John Day River (~RM 218):** Breeding waterfowl, salmon concentrations and habitat, cultural resource area, resident warm water fish, winter waterfowl concentrations, heavy shorebird use.
3. **Goodnoe Waterfowl area (~RM 226):** Waterfowl concentration area. Public recreation area.
4. **Chapman Creek Waterfowl area (~RM 236):** Impounded wetland. Sensitive nesting species; goose wintering/loafing area; salmonid spawning and rearing area, cultural resources. Public recreation area (Sundale Park).
5. **Wood Gulch (~RM 243):** Salmonid concentrations and habitat, resident warm-water fish nursery and adult fishery, cultural sensitive area. Concentration area for breeding, migrating and wintering waterfowl.
6. **Willow Creek (~RM 252):** Impounded shallow water habitat. Salmonid concentration and rearing habitat, resident warm-water fish, winter waterfowl production, shorebirds.
7. **Three Mile Canyon (~RM 256):** Colonial nesting birds (including Caspian tern), salmonid concentrations, habitat and waterfowl.
8. **Umatilla National Wildlife Refuge (~RM 261-283):** Numerous islands, sloughs and wetlands provide rearing habitat for juvenile salmonids and resident fish. Very large (hundreds of thousands) waterfowl concentration and breeding area, also provides nesting

habitat for shorebirds, herons, and sensitive species (including the American White pelican [SE], Bald eagle [FCo/SS(WA)/ST(OR)], Burrowing owl [SC]). Numerous mammals present such as deer, otter, beaver, the Townsend’s ground squirrel [SC], and the Black-tailed jackrabbit [SC].

- 9. **Plymouth Island (~RM 288-290):** Shrub steppe interspersed with wetlands and riparian areas. Large waterfowl breeding and winter concentration areas (including American white pelican [SE]), Bald eagles [FCo/SS], shorebirds, herons. Salmonid concentration and rearing habitat. Miscellaneous small mammals present. Public recreation area.
- 10. **Umatilla River/McNary Wildlife Nature Area (~RM 289):** Salmonid concentration and rearing habitat, sturgeon spawning, resident fish habitat.

Figure 6-1: Middle Columbia River, John Day Pool, Lake Umatilla (~RM 215-292).

### 6.3 CULTURAL RESOURCES AT RISK - SUMMARY

Culturally significant resources are present within the Middle Columbia River area. Information regarding the types of cultural resources and their locations is maintained by both the Washington Department of Archeology and Historic Preservation (WDAHP) and the Oregon State Historic Preservation Office (OR SHPO). This sensitive information is made available to the Washington Department of Ecology for oil spill preparedness and response planning. The Tribal Historic Preservation Offices (THPOs) of the Cowlitz, Nez Perce, Umatilla, Warm Springs, Yakama Nation, and the Confederated Tribes of the Colville Reservation, may also be able to provide information on cultural resources at risk in the area and should be contacted, along with WDAHP and the OR SHPO, through normal trustee notification processes when significant oil spills, or smaller spills above reportable thresholds, occur on the Columbia River. During a spill response, after the Unified Command is established, information related to specific archeological concerns will be coordinated through the Environmental Unit. In order to ensure that tactical response strategies do not inadvertently harm culturally sensitive sites, WDAHP and the OR SHPO should be consulted before disturbing any soil or sediment during a response action. WDAHP, the OR SHPO, and/or the Tribes may assign a person, or provide a list of professional archeologists that can be contracted, to monitor response activities and cleanup operations for the protection of cultural resources at risk. Due to the sensitive nature of such information, details regarding the location and type of cultural resources present are not included in this document.

WDAHP	(360) 586-306	<a href="mailto:Rob.Whitlam@dahp.wa.gov">Rob.Whitlam@dahp.wa.gov</a>
OR SHPO	(503) 986-0674	<a href="mailto:Dennis.Griffin@oregon.gov">Dennis.Griffin@oregon.gov</a>
Cowlitz Indian Tribe, Cultural Resources Director	(360) 577-6962	<a href="mailto:culture@cowlitz.org">culture@cowlitz.org</a>
Nez Perce Tribe, Spill Responder and Water Quality	(208) 621-3893	<a href="mailto:keithb@nezperce.org">keithb@nezperce.org</a>

Confederated Tribes of the Colville Reservation, THPO	(509) 634-2695	<a href="mailto:guy.moura@colvilletribes.com">guy.moura@colvilletribes.com</a>

### 6.3.1 Discovery of Human Skeletal Remains

Any human remains, burial sites, or burial-related materials that are discovered during a spill response must be treated with respect at all times (photographing human remains is prohibited to all except the appropriate authorities). Refer to [Section 9403 of the Northwest Area Contingency Plan](#) for National Historic Preservation Act Compliance Guidelines during an emergency response.

### 6.3.2 Procedures for the Discovery of Cultural Resources

If any person monitoring work activities or involved in spill response believes that they have encountered cultural resources, all work must be stopped immediately and the Incident Commander and Cultural Resource Specialist notified. The area of work stoppage must be adequate to provide for the security, protection, and integrity of the material or artifact(s) discovered.

**Prehistoric Cultural Resources** (May include, but are not limited to, any of the following items):

- Lithic debitage (stone chips and other tool-making byproducts)
- Flaked or ground stone tools
- Exotic rock, minerals, or quarries
- Concentrations of organically stained sediments, charcoal, or ash
- Fire-modified rock
- Rock alignments or rock structures
- Bone (burned, modified, or in association with other bone, artifacts, or features)
- Shell or shell fragments
- Petroglyphs and pictographs
- Fish weirs, fish traps, and prehistoric water craft
- Culturally modified trees
- Physical locations or features (traditional cultural properties)

**Historic cultural material** (May include any of the following items over 50 years old):

- Bottles, or other glass
- Cans
- Ceramics
- Milled wood, brick, concrete, metal, or other building material
- Trash dumps
- Homesteads, building remains
- Logging, mining, or railroad features
- Piers, wharves, docks, bridges, dams, or shipwrecks

## 6.4 ECONOMIC RESOURCES AT RISK SUMMARY

Socio-economic sensitive resources are facilities or locations that rely on a body of water to be economically viable. Because of their location, they could be severely impacted if an oil spill were to occur. Economically sensitive resources are separated into three categories: critical infrastructure, water dependent commercial areas, and water dependent recreation areas. Appendix 6 A of this chapter provides a list of economic resources for this GRP area.

## 6.5 GENERAL INFORMATION

### 6.5.1 Flight restriction zones

Flight restriction zones may be recommended by the Environmental Unit (Planning Section) for the purpose of minimizing disturbance that could result in injury to wildlife during an oil spill. By keeping a safe distance or altitude from identified sensitive areas, pilots can minimize the risk of aircraft/bird collisions, prevent the accidental hazing of wildlife into oiled areas, and avoid causing abandonment of nests. Implementation of Flight Restriction Zones will take place within the Air Operations Branch (Operations Section) after a Unified Command is formed. The Planning Section's Environmental Unit will work with the Air Ops Branch Director to resolve any potential conflicts with flight activities that are essential to the spill response effort. Typically, the area within a 1,500 ft radius and below 1,000 ft in altitude is restricted to flying in areas that have been identified as sensitive; however, some areas have more restrictive zones. In addition to restrictions associated with wildlife, Tribal authorities may also request notification when overflights are likely to affect culturally sensitive areas within reservations. See [Section 9301.3.2 and Section 9301.3.3 of the Northwest Area Contingency Plan](#) for more information on the use of aircraft and helicopters in open water and shoreline responses.

### 6.5.2 Hazing

After a Unified Command is formed, the Wildlife Branch (Operations Section) in consultation with the appropriate trustee agencies and the Environmental Unit will evaluate hazing options for the purpose of keeping un-oiled birds and marine mammals away from oil during a spill. Hazing options might include the use of acoustic or visual deterrent devices, boats, aircraft or other situation-appropriate tools. For more information see the [Northwest Wildlife Response Plan \(NWACP Section 9310\)](#) and [Northwest Area Wildlife Deterrence Resources \(NWACP Section 9311\)](#).

### 6.5.3 Oiled Wildlife

Attempting to capture oiled wildlife can be hazardous to both the animal and the person attempting the capture it. Response personnel should not approach or attempt to recover oiled wildlife. Responders should report their observations of oiled wildlife to the Wildlife Branch so appropriate action can be taken. Information provided should include the location, date, and time of the sighting, and the estimated number and kind of animals observed. Early on in the response, before a Unified Command is established, oiled wildlife sightings should be reported to Washington Emergency Management Division. For more information see the [Northwest Wildlife Response Plan \(NWACP Section 9310\)](#).
