All chapters and appendices in this plan are provided in “portrait” page orientation except Chapters 4a and 4b (PDF pp. 19-348), and the economic resources at risk listing in Appendix 6A (PDF pp. 371-376) which are provided in “landscape” page orientation.

WRIA 7

Geographic Response Plan

Purpose and Use of this Plan

This Geographic Response Plan constitutes the federal and state on-scene coordinators' orders during the initial phase of an oil spill in Water Resource Inventory Area 7 area, which includes the Snohomish, Skykomish, and Snoqualmie River Basins. It's meant to aid the response community during the initial phase of an oil spill incident; from the time a spill occurs until a Unified Command is established. The plan prioritizes response strategies based on the location where a spill might occur and the proximity of those locations to sensitive natural, cultural, and economic resources. By using this document it is hoped that immediate and proper action can be taken to minimize oil's impact on these sensitive resources.

Response Strategy Selection: The bulk of this plan is contained in Chapter 4. It provides information on GRP response strategies and the order they should be implemented based on potential spill origin points and their nearness to sensitive resources. Vicinity and sector maps and information on staging areas and boat launch locations are also provided in the chapter. After a spill occurs, the response strategies provided in Chapter 4 should be implemented as soon as possible. Unless circumstances unique to a particular spill situation dictate otherwise, the priority tables in Section 4.3 of the chapter should be used. The movement of oil and the time it takes to mobilize response resources to deploy GRP strategies must always be considered when setting strategy implementation priorities.

Control and Containment of an Oil Spill at the Source is a Higher Priority than the Implementation of GRP Response Strategies: If in the responder's best judgment control and containment of an oil spill at the source is not feasible, or the source is controlled and contained but oil has spread out beyond initial containment, then the priorities laid out in Section 4.3 of this plan take precedence until a Unified Command is formed. It is important to note that spill response priorities must rely on spill trajectory information. A booming strategy listed as a high priority in Section 4.3 would not necessarily be implemented if spill trajectory information didn't warrant action in that area. However, the priority tables should be followed until spill trajectory information becomes available. Modifications to any of the priority tables published in this plan must be approved by the Unified Command. The strategies discussed in this plan have been designed for use with persistent oils that float and remain floating on surface waters and may not be suitable for other petroleum products or hazardous substances. For hazardous substance spills, refer to the Northwest Area Contingency Plan, Chapter 7000.

Resources at Risk: Chapter 6 of this plan outlines sensitive resources at risk in the area that may be injured if impacted by oil. The implementation of certain strategies may be delayed if flight restrictions are associated with a particular resource until the required trustee consultation has been provided. Information in the chapter regarding flight restrictions should be followed before moving to implement any strategy requiring the use of aircraft.

Information in Other Chapters of the Plan: Chapter 1 provides an introduction to the plan and explains the GRP development process. Chapter 2 describes the area/site, physical features, hydrology, climate & winds, river flow/currents, and risks. Chapter 5 provides information on shoreline types and oil spill countermeasures. Finally, Chapter 7 gives information needed to support logistics during the initial phase of a response.

WRIA 7

Geographic Response Plan

Chapter 1 – Introduction

Geographic Response Plans (GRPs) are intended to help the response community avoid the initial confusion that sometimes accompanies the onset of an oil spill incident. This document serves as the federal and state on-scene-coordinators orders during the initial phase of a spill response for Water Resource Inventory Area 7 (WRIA 7). This plan has been approved by the Environmental Protection Agency Region 10 and the Washington State Department of Ecology Spills Program. Changes to this document are expected as more testing is conducted through drills, site visits, and actual use in spill situations. We value your input and hope that you'll submit comments on how the plan might be improved. Please submit comments using the information provided in Appendix "C" or online at <http://www.rrt10nwac.com/Comment>.

GRPs have been developed for the marine and inland waters of Washington, Oregon, and Idaho. They are prepared through the efforts and cooperation of the Washington Department of Ecology, Washington Department of Fish and Wildlife, Oregon Department of Environmental Quality, Idaho State Emergency Response Commission, U.S. Coast Guard, Environmental Protection Agency, other state and federal agencies, tribal and local governments, response organizations, and emergency responders. GRPs are developed through workshops and meetings with federal, state, and local oil spill emergency response experts, response contractors, tribal representatives, industry, local governments, environmental organizations, ports, and pilots. Participants identify resources that may be at risk of injury from spills, develop oil spill response strategies to reduce injury to those resources, and provide information needed to support logistics during a spill response.

After compiling information on sensitive resources in the area, site visits are conducted to gather data and determine if spill response strategies near those resources should be added, modified, or deleted. In this, the anticipated effectiveness of existing strategies is reviewed, modifications made as determined necessary, potentially unsafe or ineffective strategies removed, and new strategies added to the plan. Unfortunately, the dynamics of marine and inland water environments and the limitations of current response technology make the development of strategies for all resource locations impracticable. An updated (draft) plan is produced after site visits are completed. Comments on the draft plan are provided by trustee agencies, stakeholders, and the public. A final version of the GRP is produced. A responsiveness summary is generated for all public comments received but not incorporated into the final version of the updated GRP.

This GRP has been developed for WRIA 7, also known as the Snohomish River watershed. This GRP is located in Western Washington, near Everett. Its western and eastern boundaries are the Puget Sound and upper crest of the Cascade Mountain range. The Northern and Southern boundaries are irregular and are defined by the direction of water flow toward the center of this GRP area. This GRP covers a total of 1,980 square miles and is the second largest watershed draining into Puget Sound. Three large rivers exist within WRIA 7, the Skykomish, the Snoqualmie and the Snohomish Rivers. Although this GRP encompasses all three rivers, response strategies have only been developed for the Snohomish and Skykomish Rivers. Response strategies for the Snoqualmie River will be developed at a later date. Numerous streams exist within this GRP, 720 total miles of streams. The major cities in this GRP are Everett and North Bend.

An area site description and information on physical features, hydrology, river conditions, winds, climate, and risk are included in Chapter 2. Oil spill strategy descriptions, response priorities, and strategy maps are in Chapter 4 of this plan. Chapter 5 addresses shoreline countermeasures. Chapter 6 provides information on natural, cultural, and economic resources at risk from oil spills and discusses flight restriction zones, hazing, oiled wildlife, and the pre-cleaning of shorelines. Chapter 7 provides information on logistics and identifies resources in the area that might be available to support the initial phase of an oil spill response.

WRIA 7

Geographic Response Plan

Chapter 2 – Site Description

2.1 Chapter Introduction

This chapter provides a description of the area's physical features, hydrology, climate and winds, and an oil spill risk assessment for the area. This GRP comprises the northeastern portion of King County and the south central portion of Snohomish County. The WRIA 7 GRP is bordered by the North Central Puget Sound GRP and WRIA 6 to the west, WRIA 4 and 5 to the North, WRIA 8 to the South and WRIA 39 and 45 to the East.

WRIA 7 is located north and east of the Seattle metropolitan area. The basin is 1,978 square miles in size. Population density is greatest in the western portion of the GRP near the Puget Sound. The major cities within this GRP area are Everett and North Bend. Smaller cities include Arlington, Carnation, Duvall, Granite Falls, Gold Bar, Index, Lake Stevens, Marysville, Monroe, Mukilteo, Sammamish, Skykomish, Snohomish and Sultan.

Although this GRP encompasses the Snohomish River and its two major tributaries, the Snoqualmie and Skykomish Rivers, response strategies have only been developed for the Snohomish and Skykomish Rivers. Response strategies for the Snoqualmie River will be developed at a later date.

2.2 Physical Features

WRIA 7 is a diverse area that includes many types of habitat, from lowlands on the western portion to mountainous terrain on the eastern edge. Much of the land in the eastern portion of this GRP is rural. Everett, a port historically influenced by the logging trade is located in the far western portion of this geographic response plan. Land use activities within WRIA 7 include mining, agriculture, forestry, manufacturing, and commercial and urban development.

This geographic response plan area contains lakes and river systems that are biologically rich and sensitive. A wide diversity of bird, fish and mammal species inhabit this area. (Details can be found in Chapter 6)

2.3 Hydrology

This watershed includes the Snohomish River and its major tributaries; the Snoqualmie and Skykomish Rivers which originate in the Cascade Mountains. The watershed includes various smaller streams such as the Pilchuck, Sultan, Raging, and Tolt Rivers. The South Fork of the Tolt River provides about 30% of the drinking water for the greater Seattle area. The Spada Lake Reservoir on the Sultan River supplies drinking water and electricity to the city of Everett.

Precipitation is strongly influenced by the Cascade Mountains and is therefore highly variable, ranging from 30 inches per year near Puget Sound, to more than 185 inches per year at the crest of the Cascade Mountains on the eastern edge of the GRP area. Most of this precipitation arrives as snow during the winter months when water demands are the lowest, and only a fraction becomes available for human and economic uses. During the summer when the snowpack is gone there is little rain, so low stream flows are dependent on groundwater inflow. This means that groundwater and surface water are least available when water demands are the highest.

2.4 – Climate & Winds

WRIA 7 has a mild maritime influenced climate with cool, wet winters and mild summers. Winds are variable throughout the area with the western portion being affected by marine winds from Puget Sound. Wind speeds often vary by season, with the highest winds generally occurring from November through January. Wind gusts can occasionally reach 50 mph or greater.

2.5 Tides and Currents

The Snohomish River, to at least river mile 16, and the nearby sloughs are affected by the diurnal tidal cycle of Puget Sound. Tides and currents vary with seasonal runoff and lunar cycles in localized areas. Spill responders should consult tide and current tables for particular locations of interest.

2.6 - Risk Assessment

WRIA 7 is plentiful in natural, cultural, and economic resources, all at risk of injury from oil spills. Potential risks to these resources include oil pipelines, railroad corridors, and road transportation. Pipelines that transport large quantities of fuel from refineries in Northern Washington to population centers further south are a spill risk within this GRP. One large pipeline passes through the western portion of this GRP and transports refined petroleum products, mainly diesel and gasoline. This pipeline passes under many rivers, creeks, and wetlands and poses a major spill risk to the waterways in this GRP.

In somewhat the same fashion as pipelines, railroad and truck traffic pose a spill risk within WRIA 7. One of the main east–west transportation routes in Washington bisects WRIA 7. This route goes from Everett to the top of the Cascades at Stevens Pass and facilitates transportation on Highway 2 and the BNSF rail corridor. This rail line and Highway 2 cross waterways and run along the banks of waterways for the entire east-west length of the GRP. Train locomotives typically hold several thousand gallons of diesel fuel plus large quantities of lube and motor oils. Loaded train tank cars can contain tens of thousands of gallons of crude oil, other petroleum products, or hazardous materials. Presently the volume of oil transported by rail is increasing in the state of Washington, with this increased volume resulting in increased spill risk. Commercial trucks can contain hundreds to thousands of gallons of fuel and oil, especially fully loaded tank trucks.

Other potential risks include vessel incidents in the Snohomish River or Sloughs along the western edge of WRIA 7. These could involve marinas or vessels moored at marinas, including fishing, excursion, and recreational boat refueling incidents; boat or vessel groundings, allisions, or collisions. There are two dams and three hydroelectric generating facilities within this GRP. All of these facilities pose a possible oil spill risk. Land-based spills could also impact resources on or near sensitive shorelines.

4.0 GENERAL RESPONSE STRATEGIES

4.1 Chapter Overview

Geographic Response Plans (GRPs) are:

- Triggered in the first hours (usually 6-24) following an oil spill.
- Targeted at shielding sensitive resources that lie close to the reported spill source.
- Just one method to minimize spill impacts, they can occur concurrently with other efforts, including skimming.

On-site Considerations

Before deploying a GRP strategy, responders should ask:

- Are conditions safe?
- Has initial control and containment been sufficiently achieved?
- Underflow dams and culvert blocks require Emergency Hydraulic Project Approval (HPA) prior to implementation. These response tactics will reduce, interrupt, or divert the water flow of streams that can be damaging to sensitive fish life and habitat. Responders must receive Emergency HPA from the Washington State Department of Fish and Wildlife **before** using culvert blocks and underflow dams. The Hydraulic Code (RCW 75-20.11-160) provides for immediate verbal approval in emergency situations. For emergency HPA contact 360-534-8233 (24 hour pager).

During the initial GRP-response phase, responders should be aware that:

- Challenging field conditions may require them to modify strategies, and later notify the command center.
- Certain strategies may call for access points or staging areas that are not easily reached at all times of the year or in all conditions.
- All strategies were designed for use with persistent, heavy oils and may not be suitable for other petroleum products or hazardous materials.

- Boom deployment may require around-the-clock tending and/or precise anchoring techniques.

After considerably more is known about the spill and surrounding area:

- Other techniques for recovery or containment (skimming, in situ burning, or dispersants) may be applied.
- GRP strategies are likely to be refined as a result of lessons learned.

Term Use in Strategy Descriptions

Deployment time - Deployment time begins when crews arrive on site with necessary equipment. Deployment time does not include transit time.

(M), (W) or (H) in site contact information – (M) indicates a mobile or pager number, (W) indicates an office phone number, and (H) indicates a home phone number.

RB and LB - Right bank (RB) and left bank (LB) indicate the side of the river when facing downstream. This does not consider tidal flows. Orientation may also be given by cardinal directions.

Strategy naming convention - Inland strategy sites are named by a 3-letter river name abbreviation, followed by the river mile (measured from the mouth of the channel). This may be followed by a strategy code if there is more than one strategy at the site, or if the strategy implementation varies based on conditions. If the strategy is condition dependant it is then followed by the condition. (e.g. SNH-1.00-a-High Tide) is the strategy for the Snohomish River at river mile 1.00, it is a conditional strategy recommended for use during high tide.

Section 4.2 Strategy Priorities

This section describes three pieces of information to assist responders in planning the order and implementation of a response while in the field: general response priorities, river velocity data on sector and strategy maps, and a current chip-log table.

General Response Priorities

The following list provides the order of response in a the event of a spill into a riverine environment.

- Notify local public health and safety personnel.
- Source control and containment are always priority one. Mobilize response to the source of product.
- Work upstream from mouth to source. As resources become available, implement strategies from mouth of river and then upstream towards the source.

Historical River Velocity Ranges

The sector and strategy level maps contain characteristic river velocity information, where data is available, to assist responders in determining the time for a spill to travel downstream. This information is intended to provide the responder with a general understanding of seasonal conditions that could occur at that site. However actual conditions could vary significantly from those reported.

Sector level map legends display: potential distances that a spill could travel in 30 minutes under historical gaged high, average, and low flow conditions, the location of USGS gages, and ¼ mile hatch marks along each river. High, average and low flow conditions were calculated using the 10th percentile, average, and 90th percentile annual flows for the closest U.S. Geological Survey (USGS) gage. The USGS gage was selected based on its proximity to the site and its likelihood of providing a good representation of the main river channel flow.

Strategy level maps display historical flow information in a hydrograph and flow-velocity graph. The hydrograph displays the average monthly flow and the range of average monthly flow that has occurred at the closest USGS gage on the river. The flow-velocity graph

displays the relationship between flow and velocity that has been recorded at that gage. It should be noted that 1) flow-velocity relationships are highly variable at a single site and 2) flow and flow-velocity relationships at a site may vary significantly from these relationships in other parts of the river due to constrictions or expansions in the river, tributaries joining or diverging from the river, gradient and many other factors.

Current Chip Log

Table 4-1 presents the time for floating debris to drift 100 feet. This is most accurately determined by anchoring a line with two floating buoy markers attached at a spacing 100 feet apart. Measuring 100 feet along a straight portion of river bank may be more timely but also less accurate. Floating debris is then thrown into the water approximately 20 feet upstream of the first buoy marker. Determine the time it takes the debris to transit the distance between the two marker buoys in seconds. The table assumes that the minimum escape velocity under a boom perpendicular to the current (90 degrees) is 0.7 knots. Table 4-1 also provides an estimate of the length of boom required for deflecting oil at a specified angle for a 100-foot profile (perpendicular width) to the current. It also provides an estimate of the number of anchors or shoreline tiebacks required for that length of boom assuming anchor points are required every 50 feet. (Oil Spill Response in Fast Currents, A Field Guide. U.S. Coast Guard Research and Development Center, October, 2001)

TABLE 4-1 CURRENT CHIP LOG TABLE AND MAXIMUM BOOM DEFLECTION ANGLE

Time to Drift 100 Feet (seconds)	Velocity (ft/sec)	Velocity (m/sec)	Velocity (knots)	Max Boom Deflection Angle (Degrees)	Boom required for 100-foot Profile to Current (feet)	Anchors if Placed Every 50 feet (number)

APPENDIX B - DETAILED STRATEGY LOCATIONS AND DESCRIPTIONS

Site Lat/Long:	N 48° 2.350' / W 122° 10.004', Sector Map 7-1
Strategy Objective:	Exclusion, Collection - Deflect product into the mouth of Allen Creek for collection during high tide.
Implementation:	Deploy deflection boom across Ebey Slough. Deploy second boom across Allen Creek to prevent product from traveling too far upstream. There are good natural anchors. Culverts discharge into Allen Creek upstream of site. Small side channels near site may require lining with sorbent material.
Staging Area:	Boat, laborers and equipment launch from NC-29 (BL-275).
Field Notes:	Urban, paved, Light traffic. Culverts discharge into Allen Creek upstream of site. Site is downstream of Olympic Pipeline strategy #19.
Resources Targeted:	shorebirds, freshwater wildlife, sensitive habitat
Watercourse Description:	Creek, Field Visit Width ~ 168ft

Suggested Equipment

Quantity	Description
300 ft	1/2" Dbl Braided Propylene Line w Safety Clasps

47th Ave NE, Marysville, 98270

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 48° 2.350' / W 122° 10.004', Sector Map 7-1
Strategy Objective:	Exclusion, Collection, Deflection - Deflect product into the mouth of Allen Creek for collection during low tide.
Implementation:	Deploy deflection boom across Ebey Slough. Deploy second boom across Allen Creek to prevent product from traveling too far upstream. There are good natural anchors. Culverts discharge into Allen Creek upstream of site. Small side channels near site may require lining with sorbent material.
Staging Area:	Boat, laborers and equipment launch from NC-29 (BL-275).
Field Notes:	Urban, paved, Light traffic. Culverts discharge into Allen Creek upstream of site. Site is downstream of Olympic Pipeline strategy #19.
Resources Targeted:	shorebirds, freshwater wildlife, sensitive habitat
Watercourse Description:	River side channel, Allen Creek mouth, Field Visit Width ~ 168ft

Suggested Equipment

Driving Directions:
Cannot Drive to Site

Site Lat/Long:	N 48° 3.091' / W 122° 9.872', Sector Map 7-1
Strategy Objective:	Collection - Contain and collect product under bridge.
Implementation:	Where creek widens under bridge attach one 150 ft section of river boom across channel to collect product at right bank.
Site Safety Note:	There is heavy traffic on bridge.
Staging Area:	Stage at site from 61st St. bridge to collect product. No boat launch at site.
Field Notes:	Urban, paved, Heavy Traffic
Resources Targeted:	waterfowl, shorebirds, sensitive habitat
Watercourse Description:	Creek, Field Visit Width ~ 105ft

Closest Address:

4867 SR 528, Marysville, 98270

Driving Directions:

Depart Everett, Snohomish Cty
 1. Go West on SR 528 (64th St NE) toward 83rd Ave NE (2.51 Mile(s))
 Arrive at 4867 SR 528, Marysville, WA, 98270, on the left

Site Lat/Long:	N 47° 55.093' / W 122° 6.740', Sector Map 7-5
Strategy Objective:	Exclusion - Protect downstream wetland complex and exclude product from entering Snohomish River.
Implementation:	Block culvert in upstream end to prevent product from entering downstream wetland and eventually the Snohomish River. Creek has slow moving water. A machete is required to clear the area. Bring waders.
Site Safety Note:	Heavy traffic
Staging Area:	Staging is on the shoulder of Riverview Rd, ¼ mile west of Hwy 9
Field Notes:	Urban, paved, Heavy Traffic, will need machete to clear blackberries.
Resources Targeted:	shorebirds, salmonids (anadromous), sensitive habitat

Strategy Objective:	Collection - Collect product from creek.
Implementation:	Install an underflow dam at the top of the fish ladder just downstream of road culvert using sandbags and 8" PVC. At each fish ladder drop (3 of them) add 4x4 plywood underflow dam to retain in each pool. Downstream of fish ladder place 4 straw bales at alternating positions to capture any remaining product.
Site Safety Note:	Traffic, fast moving creek
Staging Area:	Laborers and equipment go to site, no boat required. There is a parking area to the south of the site.
Field Notes:	Rural, gravel, Heavy Traffic. 2'x2' square culvert under road. This is a Sunnyside adopt a stream project fish ladder. Site is just to west of road.
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	Creek, Unnamed tributary to Ebey Slough, Field Visit Width ~ 2ft, Field Visit Depth ~ 1ft, Field Velocity ~ 3.5MPH

Suggested Equipment

Quantity	Description
4 each	4 x 4 ft Plywood
1 ft	8 inch PVC
4 each	Bale(s)
20 each	Sandbag(s)
1 each	Vac Truck(s)

Site Lat/Long:	N 48° 0.434' / W 122° 8.339', Sector Map 7-3
Strategy Objective:	Exclusion - Exclude product from north Ebey Slough divergence.
Implementation:	Deploy river boom across mouth of divergence using large fir tree as west anchor and tallest piling to east. Deploy sorbent boom as backup to boom and to protect log jam. In stream anchoring is tide dependant. During low tide anchor boom using two anchors on one side. During high tide anchor boom in middle with anchor on each side of boom. Access site by boat. Potential access by levee road on east side of channel, but not confirmed.
Site Safety Note:	Slippery banks, log jam, tides
Staging Area:	Boat, laborers and equipment launch from NC-29 staging (BL-275).
Field Notes:	Snohomish County owns land on west bank. Private owner on east bank. May be able to access site from levee road on east side, access not field verified.
Resources Targeted:	shorebirds, salmonids (anadromous), sensitive habitat

 6. Make sharp right on Sunnyside Blvd SE (0.93 Mile(s))
- Arrive at 400 Sunnyside, Everett, WA, 98205, on the left

Site Lat/Long:	N 48° 0.039' / W 122° 8.262', Sector Map 7-3
Strategy Objective:	Collection - Collect product from Ebey Slough.
Implementation:	Utilize an anchoring system to anchor to LB shoreline (use anchor or natural anchor). Use hand bridles to maintain anchor angle. Deploy boom at 30° angle (or appropriate angle for current) to deflect product to RB. Use in stream anchor and RB outfall location as anchor points. Hand lines can be used in place of boom deflectors. Place approximately 150 ft of boom up shoreline in collection area for shoreline protection. Collect using skimmers. Use sorbent boom where appropriate for sheen control.
Site Safety Note:	Slippery banks, debris.
Staging Area:	Boat and operator go to (BL-301) SNH-1.49-staging, laborers and equipment go to site. Lake Stevens WWTP is staffed from 6:30am to 2:30 am and access gates are open during those hours. Access to the slough is possible through the plant property, directly south of the ditch that borders the southern fence of the treatment plant.
Field Notes:	Rural, gravel, light traffic, tidal influence. Use WWTP as access to levee.
Resources Targeted:	shorebirds, salmonids (anadromous), sensitive habitat
Watercourse Description:	River side channel, Field Visit Width ~ 225ft, Field Visit Depth ~ 10ft

Everett, 98205

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 47° 58.690' / W 122° 8.717', Sector Map 7-4
Strategy Objective:	Collection - Collect product at river left bank (LB) just north of bridge.
Implementation:	Deploy from south bridge pier (second pier from west) to most north-west bridge pier and west bank. Then from east bank to S. bridge pier (second pier from west). Use hand bridle and lines to manage boom angle. Use boom for shoreline protection in collection area. Collect material and pump to Vac Truck. If incoming tide is strong, can use strategy in reverse and collect product on RB.
Site Safety Note:	Slips, trips, falls, falling debris from overhead traffic, numerous bridge piers could be hazardous for boats.
Staging Area:	Can stage and launch a boat at site. Hwy 2 frontage road going east from Everett, can drive under highway on west side, park at gate. Launch boat from south side of red gate saying "no trespassing". Recommend removing boat from water at boat launch, not at site.
Field Notes:	Gravel frontage road. Debris may stack up in area. At high tide vegetation control will be needed.
Resources Targeted:	shorebirds, salmonids (anadromous), marine birds, raptors, sensitive habitat - Wetlands bank is nearby
Watercourse Description:	Slough, Ebey Slough, Field Visit Width ~ 240ft, Field Velocity ~ 1.0MPH

1. Go North on SR 9 toward 56th St SE (0 Mile(s))
 2. Turn left on 56th St SE (John Jump Rd) (0.45 Mile(s))
 3. Continue on Fobes Rd (Old Snohomish Rd) (0.52 Mile(s))
 4. Turn left on 83rd Ave SE (0.43 Mile(s))
 5. Turn right on 60th St SE (John Mack Rd) (1.86 Mile(s))
 6. Turn right on Home Acres Rd (0.57 Mile(s))
 7. Turn left on 50th Ave SE (0.01 Mile(s))
 8. Turn left at Driveway to stay on 50th Ave SE (0.05 Mile(s))
 9. Continue on 52nd Ave SE (0.03 Mile(s))
- Arrive at Point (N 47° 56.909' / W 122° 9.636'), on the left

Site Lat/Long:	N 47° 56.385' / W 122° 10.121', Sector Map 7-4
Strategy Objective:	Exclusion, Collection - Exclude product from Ebey Slough during low tide, or collect during high tide (upstream flow) at Snohomish River RB.
Implementation:	Deploy boom from water across entrance to Ebey Slough. Tie-off to pilings upstream of large maple tree on RB (east bank), wrap trees with rubber for protection. Use 5,800 pound winch hooked up to battery to tighten boom across Slough mouth. Use 20" contractor boom (lake boom: 8 float, 18 skirt) and snatch block. Estimated time of deployment is 2hrs. Alternatively, could boom bank to bank at Slough mouth and in chevron configuration in River and collect using a marco skimmer.
Site Safety Note:	Steep banks
Staging Area:	Boat, equipment, and laborers go to SNH-1.49-staging (BL-301).
Field Notes:	Boat access only
Resources Targeted:	waterfowl, salmonids (anadromous), raptors
Watercourse Description:	River side channel, Ebey Slough and Snohomish River, Field Visit Width ~ 453ft, Field Velocity ~ 0.5MPH

Site Lat/Long:	N 47° 54.108' / W 122° 5.245', Sector Map 7-5
Strategy Objective:	Initial Containment - Collect product in Pilchuck River at river left.
Implementation:	Access river from the south side. Cross river using rope to pull boom upstream. Anchor boom from rock off point to eddy just downstream of path (west of bridge). Collect product to road. Pumps may be used in place of vac truck. Raft, Jon boat, or belly boat recommended. Clearing of knot weed on south bank will be required in preparation for emergency response.
Site Safety Note:	Steep path, slippery sand, traffic on bridge
Staging Area:	Laborers and equipment go to site. Access the river at south of Lincoln Bridge on west side. Block lane of road for staging, or stage from north west side on private cattle land. Land owner has not been contacted. Get permission for access to cattle ranch.
Field Notes:	Significant knotweed along banks, will need to be cleared prior to implementation. North side of river has a lot of fencing.
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River without a dam, fast current, Field Visit Width ~ 27ft, Field Velocity ~ 3.6MPH, steep rip-rap banks

 7. Continue on Old Snohomish Monroe Rd (0.15 Mile(s))
- Arrive at 10704 Old Snohomish Monroe Rd. (closest address), Snohomish, WA, 98290, on the left

Site Lat/Long:	N 47° 54.703' / W 122° 4.977', Sector Map 7-5
Strategy Objective:	Collection - Collect product and pump with vac truck.
Implementation:	Natural eddies may cause pooling just downstream of bridge and upstream of this strategy, check this option. Deploy boom from deadfall tree on LB approximately 140 yards across river almost to beach. Can walk boom across with chest waders. Extend boom approximately 20 yards up shoreline for protection. Use natural anchors. Use rope and hand bridles to maintain boom angle. No boat needed for implementation.
Site Safety Note:	Steep banks with sloughing. Down climbing of ladders required for bank access.
Staging Area:	Laborers and equipment go to site, no boat required.
Field Notes:	River access limited by riparian vegetation and steep banks
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River without a dam, Pilchuck River, Field Visit Width ~ 78ft, Field Visit Depth ~ 2ft, Field Velocity ~ 3.2MPH, Cobble bottom, soft vegetated banks

Monthly Average Flow, 12150800 Snohomish River near Monroe

Average Velocity vs. Flow, 12150800 Snohomish River near Monroe

Closest Address:

16th St. (closest address), Everett, 98205

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 47° 59.656' / W 122° 10.777', Sector Map 7-3
Strategy Objective:	Collection, Diversion - Divert river at inside of bend to collection area at RB at low tide.
Implementation:	During low tide when river velocity is high, only divert 1/3 of river width. Deploy from eastern bridge pier with bridle to paravane, to boom, to RB just upstream of rowing boathouse. Anchor using #12 SARCA. A closed chevron to a marco skimmer may be applicable at this site but would need to be tested during low flow.
Site Safety Note:	Fast moving water, other boats, falling debris close to bridge pier
Staging Area:	Boat and operator go to (BL-301) SNH-1.49-staging, laborers and equipment go to site.
Field Notes:	Urban, paved, light traffic.
Resources Targeted:	shorebirds, marine mammals, salmonids (anadromous), sensitive habitat
Watercourse Description:	River with tidal influence, Snohomish River, Field Visit Width ~ 345ft, Field Visit Depth ~ 23ft, mud and rocks

Closest Address:

Pike Rd and Hwy 2, Everett, 98205

Driving Directions:

- Depart Everett, Snohomish Cty
1. Go East on SR 528 (64th St NE) toward SR 9 (0 Mile(s))
 2. Turn right on SR 9 (3.41 Mile(s))
 3. Take ramp to SR 204 (0.11 Mile(s))
 4. Bear right on SR 204 (Snohomish Marysville Rd) (2.15 Mile(s))
 5. Bear right onto ramp and go West on US 2 (0.51 Mile(s))
 6. Continue on 20th St SE (0.52 Mile(s))
 7. Turn right on 55th Ave SE (0.39 Mile(s))
 8. Turn left on Riverside Ave (0.07 Mile(s))
 9. Turn right on Pike Rd (0.09 Mile(s))
 10. Turn left to stay on Pike Rd (0.42 Mile(s))
- Arrive at Pike Rd and Hwy 2, Everett, WA, 98205, on the left

Site Lat/Long:	N 47° 58.764' / W 122° 10.998', Sector Map 7-4
Strategy Objective:	Collection - Collect product using 2 Marco Skimmers
Implementation:	Hook booms to 3 east bound Hwy 2 bridge piers w/ cable slings. Boom back to marco skimmers under west bound Hwy 2. Use 1050 ft boom for western skimmer and 900 ft boom for eastern skimmer. Install western skimmer first, on outside bend.
Site Safety Note:	Boat traffic, tide changes, falling debris from highway.
Staging Area:	Laborers and equipment go to site. Boat and operator launch from (SNH-1.49-staging (BL-301)).
Field Notes:	Under Highway 2 bridge, access road under bridges can provide vehicle access.
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River with tidal influence, tidal, Field Visit Width ~ 450ft

Suggested Equipment

Quantity	Description
100 ft	1/2" Dbl Braided Propylene Line w Safety Clasps
3 each	4 x 40 ft Cable Slings

Site Lat/Long:	N 47° 55.994' / W 122° 10.263', Sector Map 7-4
Strategy Objective:	Collection, Diversion - Divert the full river width and collect at LB.
Implementation:	When there is low current velocity deploy boom across the full river width, from beach area to opposite bank telephone post nr red bldg (approximately 2000 ft of boom). Use skimmer to collect product to Vac Truck. Place 100ft of boom along LB for protection at collection area. Use sorbent boom for sheen control on downstream side.
Site Safety Note:	Steep banks, jagged rocks.
Staging Area:	Staging area on beach. Must access staging area via locked gate. Laboreres and equipment go to site. Boat and operator launch from SNH-6.1-staging.
Field Notes:	Rural, paved, light traffic.
Resources Targeted:	waterfowl, salmonids (anadromous)
Watercourse Description:	River with tidal influence, Snohomish River, Field Visit Width ~ 300ft, Steep banks and jagged rocks on shore.

Suggested Equipment

Site Lat/Long:	N 47° 55.994' / W 122° 10.263', Sector Map 7-4
Strategy Objective:	Collection, Diversion - Divert approximately 1/3 of the river width and collect at LB.
Implementation:	When there is high current velocity take 1/3 of the river width (should capture majority of product due to location on outside river bend). Deploy boom from beach area to in stream SARCA anchor. Use skimmer to collect product to Vac Truck. Place 100ft of boom along LB for protection at collection area. Use sorbent boom for sheen control on downstream side.
Site Safety Note:	Steep banks, jagged rocks.
Staging Area:	Staging area on beach. Must access staging area via locked gate. Laboreres and equipment go to site. Boat and operator launch from SNH-6.1-staging.
Field Notes:	Rural, paved, light traffic.
Resources Targeted:	salmonids (anadromous), waterfowl
Watercourse Description:	River with tidal influence, Snohomish River, Field Visit Width ~ 300ft, Steep banks and jagged rocks on shore

Site Lat/Long:	N 47° 55.213' / W 122° 7.830', Sector Map 7-5
Strategy Objective:	Exclusion - Exclude product from wetland/open water complex.
Implementation:	Exclude the wetland complex by deploying an exclusion boom across each opening (openings are approximately 250 ft and 100ft). Booms can be deployed by boat, or from the bank on Fiddler Bluff Rd. Booms should be anchored in the middle of the channel openings to maintain shape - wider opening (west) may require 2 anchors. Estimated time for strategy deployment is 1 hour. Site is most threatened during incoming tide when river flows into wetland. Punt boat is recommended.
Site Safety Note:	Sticky mud, steep, slippery bank at access point.
Staging Area:	Laboreres and equipment go to site. Boat and operator launch from SNH-11.99-staging (BL-339).
Field Notes:	Rural, paved, light traffic. This is a future park site.
Resources Targeted:	shorebirds, salmonids (anadromous), sensitive habitat - freshwater wetland, ~5 acres
Watercourse Description:	Freshwater wetland, Wetland Complex on Snohomish River

Site Lat/Long:	N 47° 54.690' / W 122° 6.527', Sector Map 7-5
Strategy Objective:	Collection, Diversion - Collect product on north side of Hwy 9 bridge.
Implementation:	Deploy boom by boat using paravane. Anchor to rock outcrop of bridge pier on downstream end and big leaning tree (RB) as anchor on upstream end. Modify boom angle as necessary for flow and tide. Extend boom up LB for shoreline protection during collection at low tide and along RB for protection during collection during high tide. Back up boom with sorbent boom for sheen control as necessary. Recover from gravel operation on opposite (right) bank. Must close down one lane of Hwy 9 for staging. If a boat is not available a boom vane could allow boom to be installed without a boat.
Site Safety Note:	Heavy traffic, falling debris from bridge, steep banks, blackberry.
Staging Area:	Can stage from Hwy 9 bridge, must block one lane of traffic. Laborers and equipment go to site. Boat and operator launch from SNH -11.99-staging (BL-339).
Field Notes:	Urban, paved, Heavy Traffic. River velocity can be 0.5 mph upstream during high tide.
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River with tidal influence, Snohomish River, Field Visit Width ~ 300ft

Site Lat/Long:	N 47° 54.564' / W 122° 5.548', Sector Map 7-5
Strategy Objective:	Collection - Collect product in Snohomish River.
Implementation:	Deploy from LB to bridge pier (~1200 ft) and bridge pier to boat launch (225 ft). Extend boom back up shore at both shoreline anchor points (~ 120 ft) to collect during low and high tide. In low tide collect at boat launch. During high tide collect at from opposite shore. Install liner system to protect sandy banks. Universal skimmer may be used in place of brush skimmer. Estimated time for strategy implementation is 3hrs with a trained crew. Work area at boat launch is approximately 30 ft x 120 ft during low/middle tide. Keep boat ramp free and clear.
Site Safety Note:	Slips and falls on boat ramp
Staging Area:	Cady Park has boat access and space for staging. Site has 15 parking spaces, 2 boat ramps, city does not maintain boat ramp. Work area is approximately 30 feet by 120 ft. during low/middle tide. Located at the south end of Maple Ave.
Field Notes:	Urban, paved, light traffic. Tide can change water level by up to 1 meter at this location.
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River with tidal influence, Snohomish River, tidal effect on WL up to 3 feet., Field Visit Width ~ 330ft, Field Velocity ~ 1.2MPH, Sandy banks

Site Lat/Long:	N 47° 53.352' / W 122° 5.173', Sector Map 7-5
Strategy Objective:	Collection - Collect product on upstream side of pump station at French Slough.
Implementation:	Contact pump station to request that pumps are shut-off. Deploy sorbent boom across shutoff pumps on upstream side of pump station. Deploy river boom from RB using natural anchors to LB and up shoreline for protection. Collect using skimmer. Jon or punt boat are recommended.
Site Safety Note:	Pump station
Staging Area:	Boat, laborers and equipment go to site. Key to gates on pump station fence behind white tag on fence (by gate). May be desirable to access via Darlington Farm (property to north) as levee ground may be soft. No boat access for Snohomish River here.
Field Notes:	Rural, gravel, light traffic.
Resources Targeted:	salmonids (anadromous)

Site Lat/Long:	N 47° 53.147' / W 122° 5.243', Sector Map 7-5
Strategy Objective:	Deflection, Collection - Deflection of product from French Creek Slough Pump Station.
Implementation:	Deploy 1200 ft of boom as deflection from upstream oxbow to debris in river (or in stream anchor). Deploy 600 ft of boom for collection from in stream anchor to beach line. Deploy boom up shoreline for protection. Place sorbent boom downstream of boom for sheen control. 12 boom deflectors are recommended but if they are not available then do not place boom from oxbow to debris. Use in stream SARCA #12. Estimated deployment time is 3hrs with 2 boats. Jet boats are required to access site due to river rapids.
Site Safety Note:	Dense vegetation along banks. Levee can be very soft for driving.
Staging Area:	Stage on Darlington Farms property. Laborers and equipment go to site. Can access from Treosti Road or through Darlington Farms. Boat and operator launch from SNH-11.99-staging (BL-339).
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River with tidal influence, Snohomish River, Field Visit Width ~ 390ft, Field Velocity ~ 2.1MPH

Suggested Equipment

Quantity	Description
3600 ft	1/2" Dbl Braided Propylene Line w Safety Clasps
1 each	Anchor(s) for strong currents - ie. SARCA
1900 ft	B3 - River Boom, or other appropriate type
12 each	Boom Deflector(s)
1 each	Diaphragm Pump(s)
10 each	Hand Bridle(s)
1	Jet Boat
1 each	Paravane(s)
60 ft	Sorbent Boom
1 each	Weir Skimmer(s)

Suggested Personnel

2	Boat Operator (s)
11	Laborer (s)
1	Supervisor (s)

Status: Visited and Not Tested 10/17/2006

Monthly Average Flow, 12150800 Snohomish River near Monroe

Average Velocity vs. Flow, 12150800 Snohomish River near Monroe

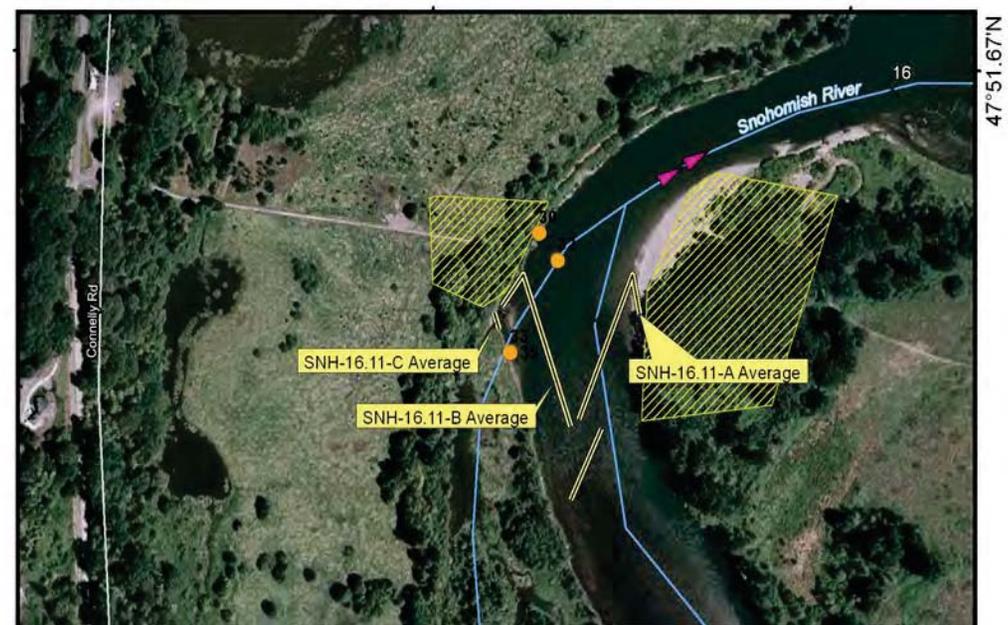

Closest Address:

10800 Treosti Rd., Snohomish, 98290

Driving Directions:

- Depart Snohomish, Maple and 2nd Ave
1. Go South on SR 9 toward Ridge Ave (0.82 Mile(s))
 2. Make sharp left on Ridge Ave (0.24 Mile(s))
 3. Make sharp left on Bickford Ave (AVE D) (0.28 Mile(s))
 4. Continue on AVE D (1.08 Mile(s))
 5. Turn left on 1st St (0.59 Mile(s))
 6. Turn right on Lincoln Ave (0.33 Mile(s))
 7. Continue on Old Snohomish Monroe Rd (0.58 Mile(s))
 8. Make sharp right on French Slough Rd (0.28 Mile(s))
 9. Turn left on Unnamed St (0.71 Mile(s))
 10. Turn right on Treosti Rd (Happy Valley Rd) (0.22 Mile(s))
- Arrive at 10800 Treosti Rd., Snohomish, WA, 98290, on the left

Site Lat/Long:	N 47° 51.518' / W 122° 4.872', Sector Map 7-6
Strategy Objective:	Collection, Deflection - Cascade booms to collection site at RB.
Implementation:	Deploy upstream deflection boom to deflect product to collection boom, anchor using 2 SARCA and check angle based on current velocity. Deploy collection boom downstream of deflection boom to collect at RB. Boom should extend from RB beach across 1/3 to 1/2 of river (1/2 width requires ~750 ft), tie into SARCA in stream anchor. Deploy ~ 120 ft of boom along beach at collection area for shoreline protection. Use sorbent boom for sheen control on downstream side. Estimated to take 2 hours to deploy. Use in conjunction with SNH-16.11-B and A; deploy SNH-16.11-A first.
Site Safety Note:	Other boats, steep and slippery bank at LB, slippery cobbles at RB, fast current.
Staging Area:	Snohomish County owns property on right and left bank. Stage from Shorts School Road on RB, from Connelly Rd. on LB. Stage equipment for 16.11 A, B, and C together. Laborers and equipment go to site. Boat and operator launch from SNH-11.99-staging (BL-339).
Field Notes:	Jet boat required to access site from BL-339.
Resources Targeted:	salmonids (anadromous)
Watercourse Description:	River with tidal influence, Snohomish River, Field Visit Width ~ 450ft, Field Velocity ~ 2.4MPH

Suggested Equipment

Quantity	Description
705 ft	1/2" Dbl Braided Propylene Line w Safety Clasps
3 each	Anchor(s) for strong currents - ie. SARCA
850 ft	B3 - River Boom, or other appropriate type
5 each	Boom Deflector(s)
240 ft	Chain
6 each	Drive Pin(s)
3 each	Hand Bridle(s)
2	Jet Boat
2 each	Paravane(s)
200 ft	Sorbent Boom
1 each	Towing Bridle(s)
1 each	Universal Skimmer(s)
2 each	Vac Truck(s)

Suggested Personnel

2	Boat Operator (s)
9	Laborer (s)
2	Supervisor (s)

Status: Visited and Not Tested 10/20/2006

Monthly Average Flow, 12150800 Snohomish River near Monroe

Average Velocity vs. Flow, 12150800 Snohomish River near Monroe

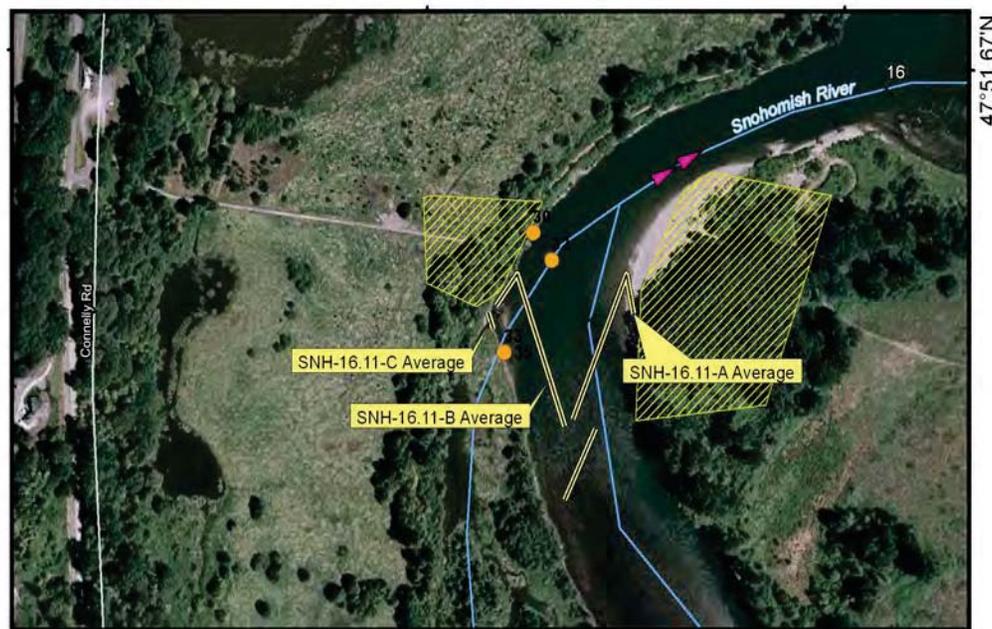

Closest Address:

Elliot Road, N of State Rte 522,
Snohomish, 98296

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 47° 49.964' / W 122° 2.880', Sector Map 7-6
Strategy Objective:	Collection - Collect product from Snohomish River near Route 522 bridge.
Implementation:	Deploy hard boom from trees on southeast (left) bank upstream of bridge to intermediate bridge pier, and bridge pier to sand bar on northeast bank (approximately 1200 ft). Continue boom back upstream to protect shoreline. Use sorbent material on both sides of boom for sheen control. Maintain 45° boom angle, or suitable angle for current. Vehicles cannot access bank, so product must be pumped (15-20 ft head) using hose (~400 ft) and 3" diaphragm pump to vac trucks. Boom deflectors can be substituted for rope. May use water bladder for forming to side channels.
Site Safety Note:	High slippery banks.
Staging Area:	Stage at the barn on park property RB. Emergency vehicle access is at the west end of Old Tester Road. There is a very small parking area just outside the park gate, used primarily by fishermen to access the river. There is also roadside parking (primarily for fishermen) on Tester Road from near SR-522 to Old Tester Road. Laboreres and equipment got to site. Boat and operator launch from SNQ-2.88-staging (BL-378).
Field Notes:	Rural
Resources Targeted:	habitat restoration/mitigation site - There is a restoration site near collection pt.
Watercourse Description:	River with tidal influence, Field Visit Width ~ 495ft, Field Velocity ~ 1.2MPH

N/A, Everett, 98205

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 48° 0.636' / W 122° 9.280', Sector Map 7-3
Strategy Objective:	Exclusion - Exclude product from side channel, wetlands, tidal marsh.
Implementation:	Access site by boat and place 50 ft sorbent boom into side channel. Dam breaching is planned for the near future in this area. There are 2 similar channels within 100 yards to the south that will also require 50 ft of sorbent boom each. Additional boom length included in equipment list.
Site Safety Note:	Slippery banks
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	Undeveloped, tidal influence.
Resources Targeted:	shorebirds, sensitive habitat
Watercourse Description:	River side channel, Side channel to Steamboat Slough, Field Visit Width ~ 25ft, Field Visit Depth ~ 20ft

Suggested Equipment

 Everett, 98205

Driving Directions:
 Cannot Drive to Site

Site Lat/Long:	N 48° 0.378' / W 122° 9.258', Sector Map 7-3
Strategy Objective:	Exclusion - Exclude product from side channel.
Implementation:	Exclude side channel using closed chevron configuration with one leg longer and at a shorter angle. Place longer leg in direction of tidal flow. Anchor apex using SARCA anchor.
Site Safety Note:	Slips and falls
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	Undeveloped land. Fast current, tidal influence.
Resources Targeted:	shorebirds, sensitive habitat
Watercourse Description:	River side channel, Steamboat Slough side channel, Field Visit Width ~ 6ft, Field Visit Depth ~ 5ft

Suggested Equipment

Quantity	Description
125 ft	1/2" Dbl Braided Propylene Line w Safety Clasps
1 each	Anchor(s) for strong currents - ie. SARCA
100 ft	B3 - River Boom, or other appropriate type
1 each	Boat(s)
60 ft	Chain
2 each	Wing Anchor(s)

Levee Breach, Everett, 98205

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 48° 0.207' / W 122° 9.195', Sector Map 7-3
Strategy Objective:	Collection - Collect product during low tide in Steamboat Slough.
Implementation:	Collect product using an inverted Chevron during low tide. Install boom approximately 1500 feet upstream of the levee breach. Use boom deflectors to maintain angle. Collect product using marco skimmer.
Site Safety Note:	There is a very powerfull in flow to Spencer Island during high tide, caution is advised.
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	The NE side of Spencer Island will not be accessible by land in the near future. WDFW and Ducks Unlimited are breaching the dike to improve fish passage.
Resources Targeted:	shorebirds, salmonids (anadromous), marine mammals, sensitive habitat - Spencer Island Wetlands
Watercourse Description:	River with tidal influence, Steamboat Slough,

Suggested Equipment

Everett, 98205

Driving Directions:
Cannot Drive to Site

Site Lat/Long:	N 48° 0.207' / W 122° 9.195', Sector Map 7-3
Strategy Objective:	Collection - Collect product during high tide at RB (east bank).
Implementation:	Deploy boom from RB to inline anchor. Use two SARCA anchors with 60 ft of chain between boom and SARCA and between the two SARCA's. Deploy boom at 30° angle from shore or angle as appropriate for flow velocity. Boom should take approximately 1/3 of river due to high velocity, but may take entire width. Check current.
Site Safety Note:	There is a very powerfull in flow to Spencer Island during high tide, caution is advised.
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	The NE side of Spencer Island will not be accessible by land in the near future. WDFW and Ducks Unlimited are breaching the dike to improve fish passage.

Driving Directions:

Cannot Drive to Site

Site Lat/Long:	N 48° 0.059' / W 122° 9.143', Sector Map 7-3
Strategy Objective:	Exclusion - Exclude product from Spencer Island wetlands.
Implementation:	At low tide, exclude product using close chevron formation at mouth of levee breach. The wide and flat, long leg should be in the direction of flow, limit pressure on short leg by checking angle. Tie off to trees at downstream end. Depending on tidal flow could anchor bank to bank across breach starting upstream approximately 1000 ft. Access site by boat from Langus Riverfront Park.
Site Safety Note:	There is a very powerfull in flow to Spencer Island during high tide, caution is advised.
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	The NE side of Spencer Island will not be accessible by land in the near future. WDFW and Ducks Unlimited are breaching the dike to improve fish passage.
Resources Targeted:	shorebirds, salmonids (anadromous), marine mammals, sensitive habitat - Spencer Island Wetlands

Status: Visited and Not Tested 10/19/2006

Site Lat/Long:	N 47° 59.588' / W 122° 9.039', Sector Map 7-3
Strategy Objective:	Exclusion - Exclude product from entering tidal slough on southern bank.
Implementation:	Deploy boom across mouth of tidal channel on RB using natural anchors. Place sorbent boom upstream of river boom for sheen control. Use caution because it lies directly behind dock which makes it difficult to deploy equipment. The tidal channel is bisected by small island. At south end of island add 150 ft of sorbent boom.
Site Safety Note:	Slippery banks, deep mud on road and bank.
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	There is a dock directly in front of side channel. May be able to access site from dirt road off 63rd Ave, however access by land has not been tested.
Resources Targeted:	shorebirds

Site Lat/Long:	N 47° 59.042' / W 122° 9.905', Sector Map 7-3
Strategy Objective:	Collection - Collect product from Steamboat Slough. Recover product and remove by boat/landing craft.
Implementation:	Deploy boom across Steamboat Slough from beach on southern bank to point between Union Slough and Steamboat Slough. Strategy should be effective for high and low tide with appropriate anchoring and shoreline protection. Collect at LB for high tide and recover product in 40 gallon drums and remove by boat or landing craft. Collect at RB during low tide using Vac Truck or boat. For shoreline/beach protection, lay tarp and anchor in.
Site Safety Note:	Deep mud, vegetation, hunters
Staging Area:	Laborers and equipment go to site. Can access site from Pike Road off of Cherry Ave. Stage laborers and equipment for UNS-4.36 from this site also. Boat and operator launch from SNH-1.49-staging (BL-301).
Field Notes:	Urban, paved, light traffic.
Resources Targeted:	salmonids (anadromous), raptors
Watercourse Description:	Slough, Steamboat Slough, Field Visit Width ~ 210ft, Field Visit Depth ~ 7ft, Field Velocity ~ 0.7MPH,

400 Sunnyside Blvd., Everett, 98205

Driving Directions:

- Depart Snohomish, Maple and 2nd Ave
1. Go North on SR 9 toward 56th St SE (0.53 Mile(s))
 2. Turn left onto ramp and go North West on US 2 (2.33 Mile(s))
 3. Bear left on SR 204 (Snohomish Marysville Rd) (0.66 Mile(s))
 4. Turn left on Sunnyside Blvd SE (1.32 Mile(s))
- Arrive at 400 Sunnyside Blvd., Everett, WA, 98205, on the left

Site Lat/Long:	N 48° 0.731' / W 122° 9.318', Sector Map 7-3
Strategy Objective:	Exclusion, Collection, Deflection - Prevent product from moving across connection channel into Union Slough or Steamboat Slough.
Implementation:	Deploy boom from southwest point to northwest point of channel connection to prevent product movement from Steamboat to Union Slough. During low tide boom will exclude product from Union Slough, during high tide collect at south west end. If product is in Union Slough deploy in conjunction with UNS-2.15 B. Place shoreline protection boom along shore in collection area.
Site Safety Note:	Slippery banks (silty)
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	Rural, gravel/dirt, light traffic, tidal influence. Public land. Land access not confirmed, vac truck may not be able to gain access to levee road on west bank Union Slough, access by boat.
Resources Targeted:	shorebirds, salmonids (anadromous), freshwater wildlife, sensitive habitat
Watercourse Description:	River side channel, Field Visit Width ~ 150ft

Suggested Equipment	
Quantity	Description
1200 ft	1/2" Dbl Braided Propylene Line w Safety Clasps
390 ft	B3 - River Boom, or other appropriate type
1 each	Boat(s)
60 ft	Chain
1 each	Diaphragm Pump(s)
8 each	Hand Bridle(s)
10 each	Stake(s)
2 each	Towing Bridle(s)
1 each	Universal Skimmer(s)
2 each	Wing Anchor(s)

Site Lat/Long:	N 48° 0.731' / W 122° 9.318', Sector Map 7-3
Strategy Objective:	Collection, Diversion, Exclusion - Collect product in Union Slough.
Implementation:	Complete in conjunction with UNS-2.15 A. Deploy boom from LB Union Slough to south point of channel connection. During low tide collect on LB, during high tide collect at south point of channel connection with UNS-2.15A. Place shoreline protection boom along shore in both high tide and low tide collection areas. Keep boom taut using SARCA in stream. Access site by boat.
Site Safety Note:	Slippery banks (silty)
Staging Area:	Boat, laborers and equipment launch from SNH-1.49-staging (BL-301).
Field Notes:	Rural, gravel/dirt, light traffic, tidal influence. Public land. Land access not confirmed, vac truck may not be able to gain access to levee road on west bank Union Slough, access by boat.

Site Lat/Long:	N 47° 59.614' / W 122° 9.897', Sector Map 7-3
Strategy Objective:	Collection - Collect product in Union Slough.
Implementation:	Anchor to locked stanchions at downstream end, walk boom across wooden pedestrian bridge and tie off to natural anchor near bridge on LB. Use a portion of boom for LB shoreline protection in collection area. Access via 4th St. SE through the Everett Water Pollution Control Facility. If strategy is only for sheen control in Union Slough use 430 ft of sorbent boom. Can deploy without a boat.
Site Safety Note:	Congestion of vehicle traffic due to limited parking.
Staging Area:	Stage at site. Access site through the Everett Water Pollution Control Facility on 4th St. SE. Can stage from dirt path and LB downstream of bridge. It's approximately 0.9 miles from Langus Park boat ramp to Spencer Island bridge.
Field Notes:	Rural, gravel, light traffic.
Resources Targeted:	shorebirds, salmonids (anadromous), sensitive habitat - Spencer Island Wetland
Watercourse Description:	Slough, Union Slough, Field Visit Width ~ 135ft, Field Velocity ~ 0.5MPH

Site Lat/Long:	N 48° 0.294' / W 122° 7.752', Sector Map 7-3
Strategy Objective:	Collection - Collect product in pond.
Implementation:	Place boom across downstream end of pond, upstream of culvert. The pond surface area is approximately 150 ft by 45 ft. Let product settle out in pond and skim / boom sweep. OPLC Heineck Farm strategy site #1 is downstream of this spot.
Site Safety Note:	Steep, slippery bank
Staging Area:	Heineck Farm can be reached from Sunnyside Blvd. The farm has single lane dirt road near the site where staging can occur.
Field Notes:	Rural, gravel, light traffic on farm property. Sunnyside Blvd has heavy traffic.
Resources Targeted:	shorebirds
Watercourse Description:	Ditch, Weiser Creek/Unnamed Creek, Field Visit Width ~ 4ft, Field Visit Depth ~ 2ft, Field Velocity ~ 3.0MPH

Before you print this document:

This chapter and appendices are provided in “landscape” page orientation. The detailed (2-page) response strategy information in Appendix 4A, notification strategy information in Appendix 4B, staging area information in Appendix 4C, and boat launch location information in Appendix 4D (PDF pp. 321-348) have all been designed for duplex printing (front and back side of paper), “open to top” configuration.

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

4.1 - Chapter Introduction

This chapter provides information on GRP response strategies and the order (priority) they should be implemented based on potential spill origin points, and the proximity of sensitive resources to them. Area maps, sector maps, and information on staging areas and boat launch locations are also provided in this chapter. During a spill incident, GRP response strategies should be implemented as soon as possible. Unless circumstances unique to a particular spill situation dictate otherwise, the priority tables in Section 4.3 should be used to decide the order that GRP strategies are deployed. The downstream movement of oil and the time it takes to mobilize response resources to deploy GRP strategies must always be considered when setting implementation priorities. Information on shoreline types and countermeasures, resources at risk/sensitive areas, and flight restrictions can be found in Chapter 5 and Chapter 6 of this plan. Information on protection techniques can be found in Appendix A of this plan.

The Geographic Response Plan (GRP) strategies provided in this chapter have been created to reduce spilled oil's impact on sensitive resources. They are not everything that should or could be done during a response to lessen the chance of injury to natural, cultural, and economic resources at risk from oil spills. Although designed to be implemented during the initial phase of an oil spill, GRP strategies may continue to be used throughout a response at the discretion of the Incident Commander or Unified Command.

4.1.1 – On-site Considerations:

Before Deploying a GRP Strategy: (Questions to Ask)

- Are conditions safe? Response managers and responders must first determine if efforts to implement a response strategy would pose an undue risk to worker safety or the public, based on conditions present during the time of the emergency. No strategy should be implemented if doing so would threaten public safety or present an unreasonable risk to the safety of responders.
- Has initial control and containment been sufficiently achieved? Source control and containment of the spill at or near the source are always higher priorities than the deployment of GRP response strategies, especially when concurrent response activities are not possible.
- How far downstream or out into the marine environment is the spilled oil likely to travel before response personnel will be ready and able to deploy GRP response strategies?

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

- Is an Emergency Hydraulic Project Approval (HPA) required prior to implementing a particular strategy? In Washington State, the implementation of any response strategy that reduces, interrupts, or diverts the flow of water in streams, including the installation of culvert blocks and underflow dams, requires an Emergency HPA from the Washington Department of Fish and Wildlife (WDFW). To obtain an Emergency HPA, contact WDFW at 360-534-8233 (24-hour pager).
- Will equipment or vehicles need to be staged on or near a roadway? If so, traffic control may be required. Contact the Washington State Patrol or local, county, municipality, or tribal police for assistance. At minimum, [Washington Department of Transportation \(WADOT\) guidelines](#) for work zone traffic control should be followed when working on or near a roadway.
 - Washington State Patrol – District 7 (360) 805-1153
 - City of Monroe Police-(360) 794-6300
 - City of Gold Bar Police- (360) 793-8986
 - City of Sultan Police- (425) 388-6260
 - Snohomish County Sheriff’s Office- (425) 388-3393
 - King County Sheriff Skykomish Substation- (360) 677-2803
 - Tulalip Tribal Police (360) 716-4608

During Strategy Implementation: (Things to Remember)

- On-scene conditions (weather, currents, tides, waves, river speed, and debris) may require that strategies be modified in order to be effective. There is a significant chance that weather and conditions experienced at a particular strategy location during an actual spill event will be different from that when data was gathered during field visits. Response managers and responders must remain flexible and modify the strategies provided in this chapter as needed to meet the challenges experienced during an actual response.
- Certain strategies may call for access points or staging areas that are not easily reached at all times of the year or in all conditions.
- Oil containment boom must be free of twists, gaps, and debris in order to remain effective.

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

- The GRP response strategies provided in this chapter were designed for use with persistent heavy oils that float on water and may not be suitable for other petroleum products or hazardous substances.

After Strategy Implementation: (Things to Understand)

- Oil containment boom should be maintained and periodically monitored to ensure its effectiveness. Changes in river speed will likely require modifications to boom deflection angles. Depending on conditions, some booming strategies may require around-the-clock tending.
- Although designed for implementation during the initial phase of an oil spill, GRP strategies may continue to be deployed and implemented throughout the entire lifespan of a response, as determined appropriate and necessary by the Incident Commander or Unified Command.

4.1.2 - Historical River Stream Flow Ranges:

Gage/stream flow data from U.S. Geological Survey (USGS) was used to calculate mean monthly stream discharge. A 25-year monthly average from January, 1985 through December, 2010 was used. Stream discharge is recorded in cubic feet per second (cfs); velocities in miles per hour (mph) or nautical miles per hour (knots) are not available because they are subject to change, dependent on the configuration of the riverbed. Table 4.1 provides information that can be used to calculate river velocities based on the time it takes a floating object to drift 100 feet downstream from any given point in a river or creek. Additional information on calculating river velocities can be found in Appendix A of this plan.

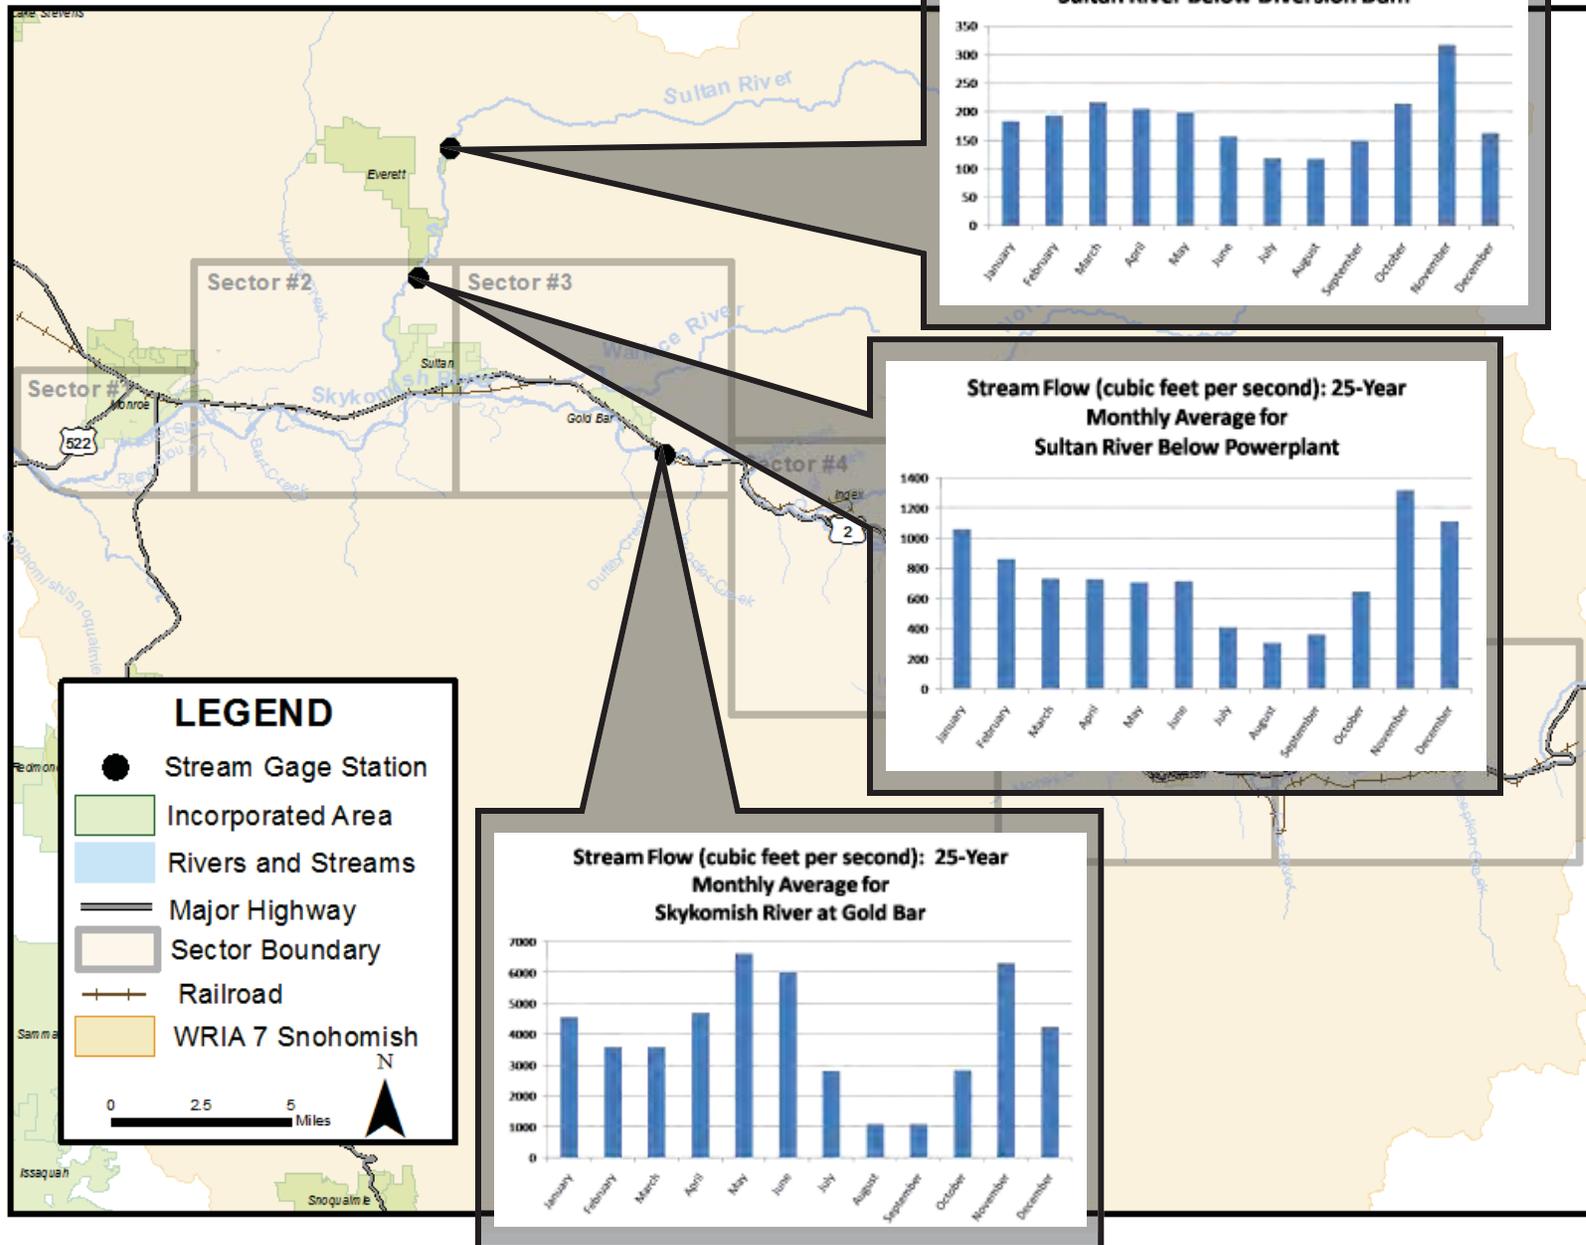

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

Table 4.1 – Historic Stream Flow for Skykomish River and Tributaries

Stream Flow (cubic feet per second): 25-Year Monthly Average			
	Skykomish River at Gold Bar	Sultan River Below Diversion Dam	Sultan River Below Powerplant
January	4570	183	1060
February	3590	193	861
March	3590	216	731

How to Estimate Water Speed to Determine the Maximum Boom Deflection Angle:

Anchor a line with two floating buoy markers attached at a spacing 100 feet apart (measuring 100 feet along a straight portion of river bank may be more timely but also less accurate). Floating debris is then thrown into the water approximately 20 feet upstream of the first buoy marker. Determine the time it takes the debris to transit the distance between the two marker buoys in seconds.

Use the following table to estimate water speed and the maximum boom deflection angle:

Table 4.2 – Water Speed Drift Measurement Table

Time to Drift 100 Feet (seconds)	Velocity (ft/sec)	Velocity (m/sec)	Velocity (knots)	Max Boom Deflection Angle (degrees)	Boom required for 100-foot Profile to Current (feet)	Anchors if Placed Every 50 feet (number)
6	16.7	5.1	10.00	4.0	1,429	30

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

4.2 – Area Overview Maps

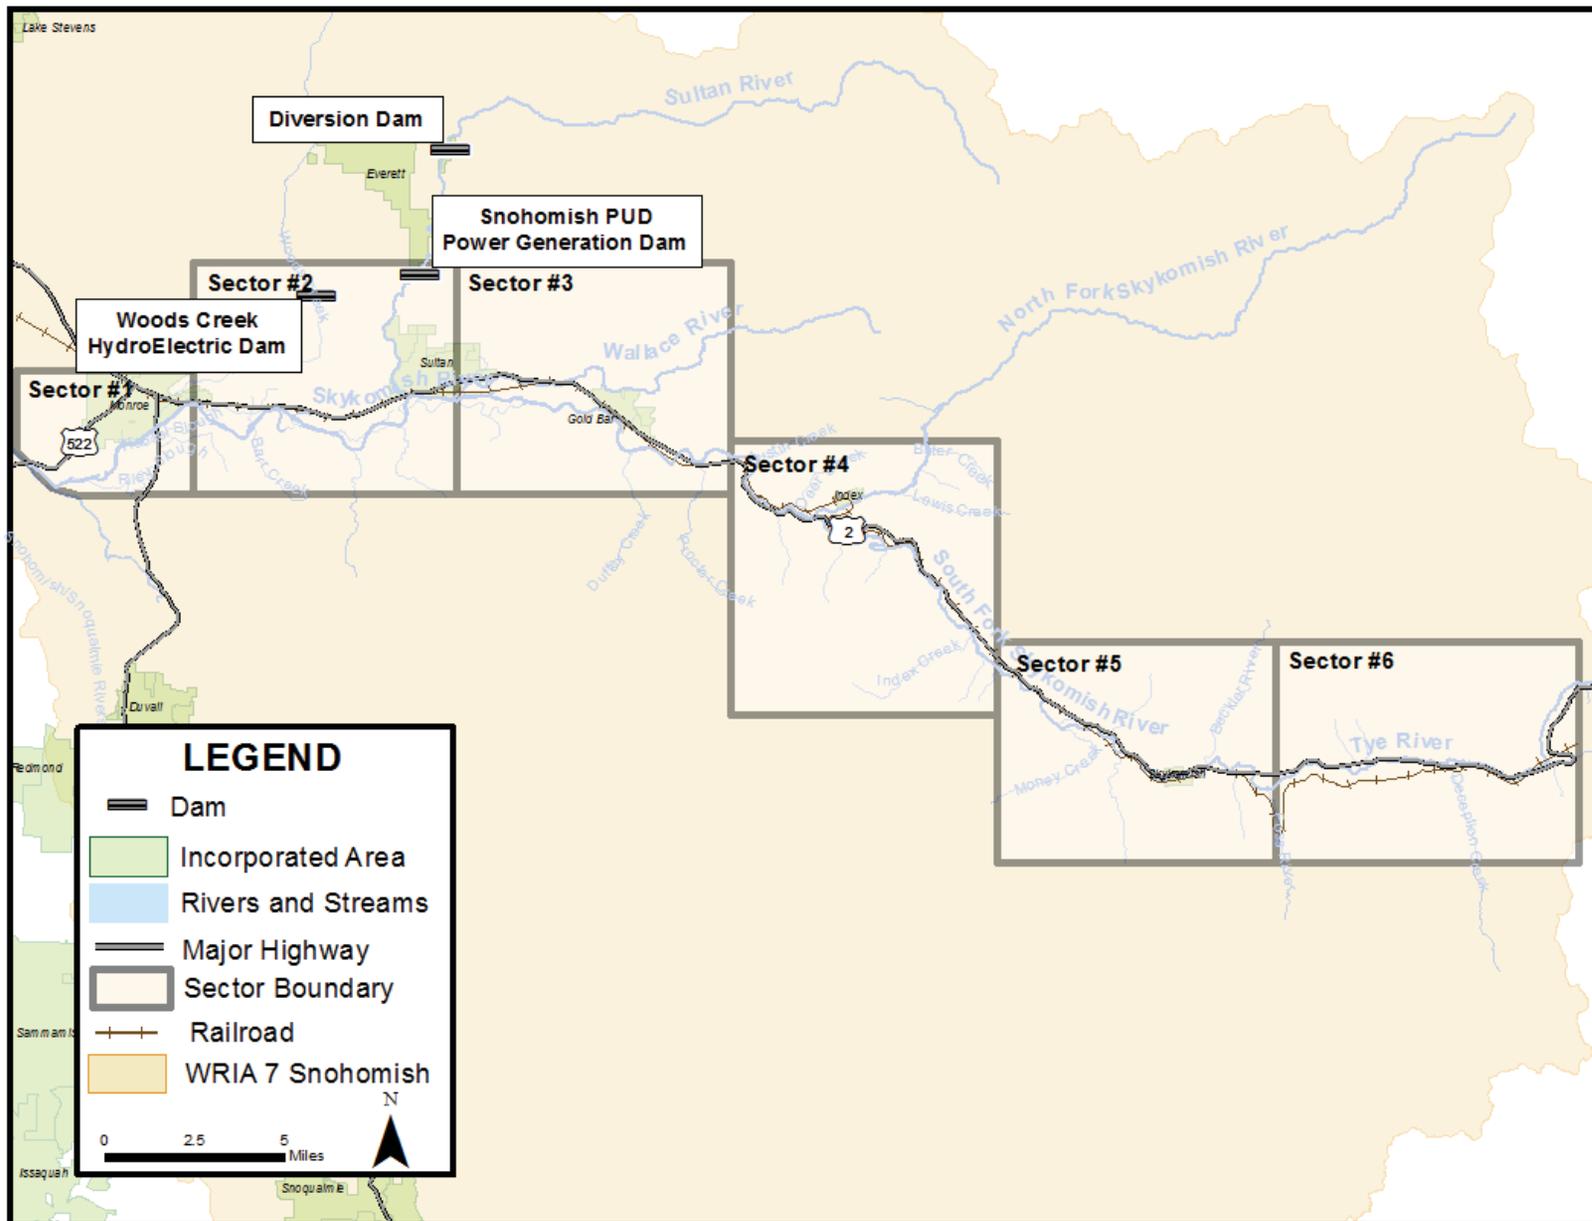

The following maps are meant to provide a geographic overview of the WRIA 7 Skykomish River GRP area. Sector maps in Section 4.4 of this chapter provide more detail on the locality of response strategies, spill origin points, staging areas, and boat launch locations. Detailed information on strategies, staging areas, and boat launches can be found in the chapter appendices.

The following area maps are provided for reference:

- Dams
- Response Strategy Locations
- Notification Strategy Locations
- Staging Areas
- Boat Launch Locations
- Spill Origin Points

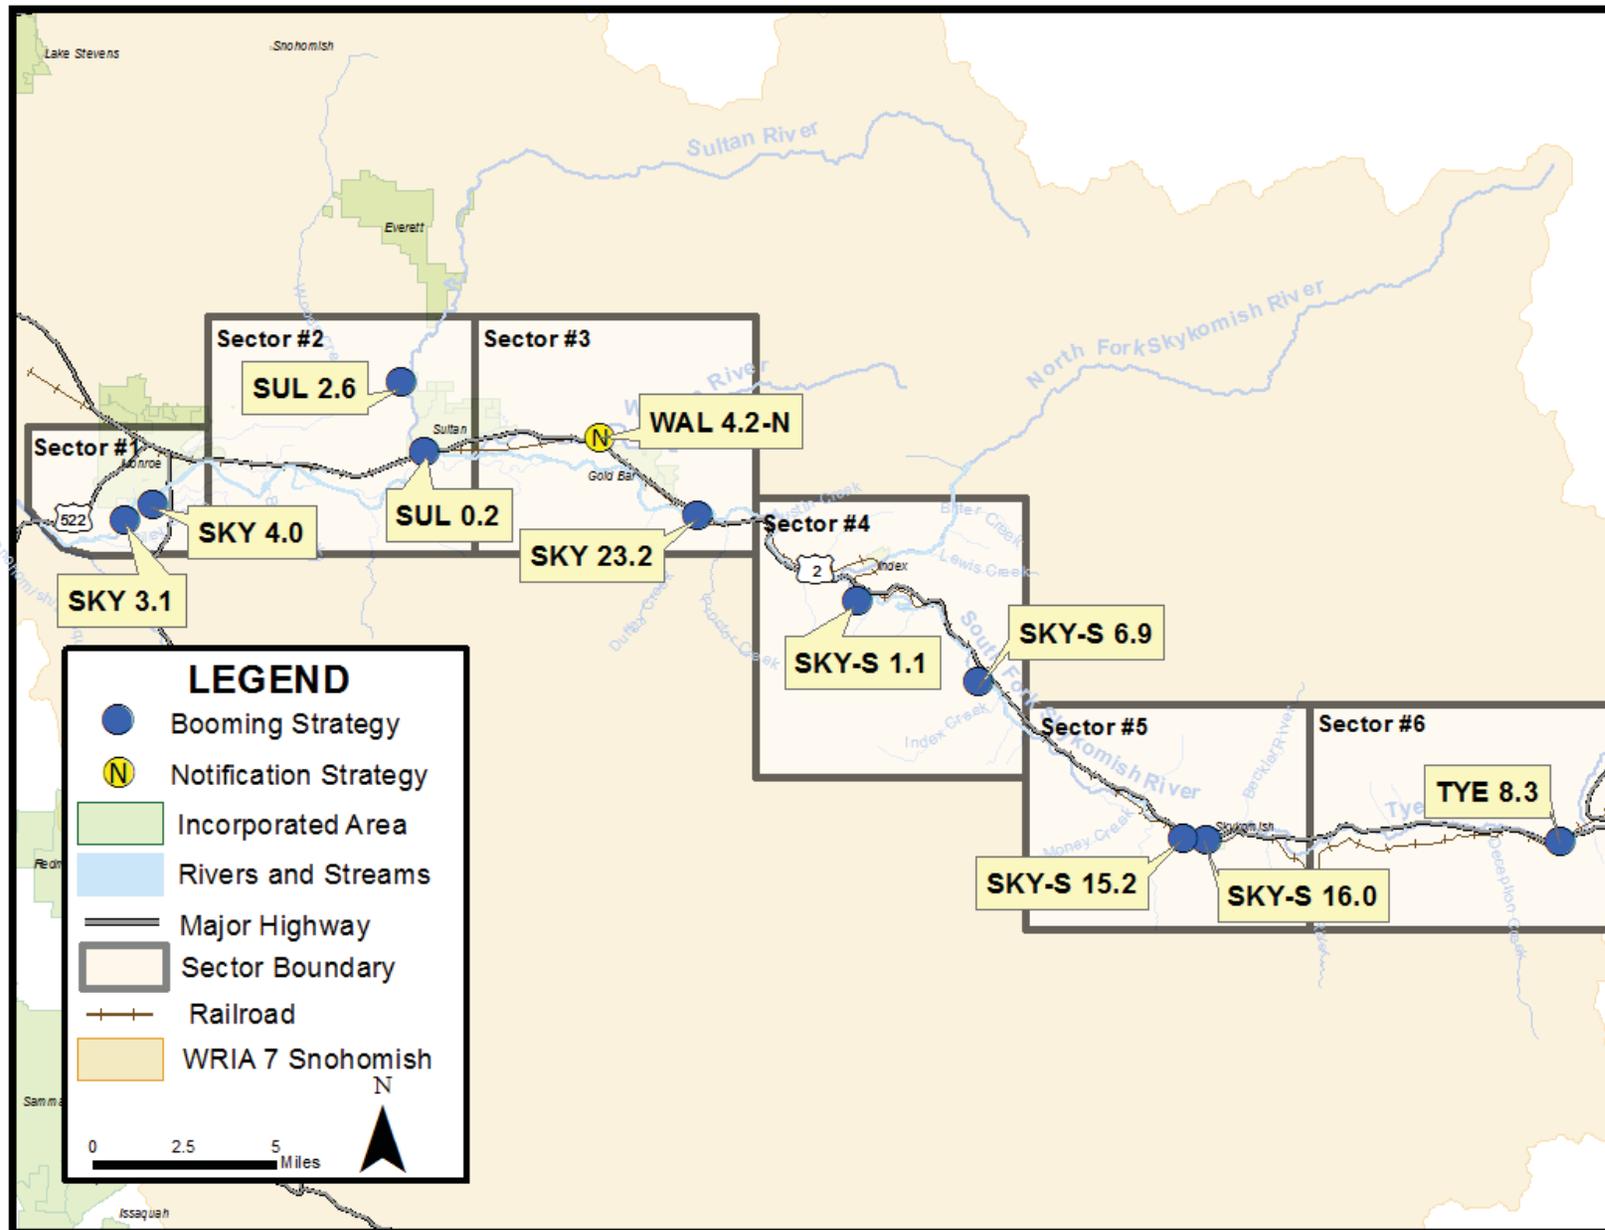

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

4.3 – Strategy & Response Priorities

4.3.1 - General Response Priorities: The following list provides the order of response priorities after an oil spill impacts the Skykomish River or one of its tributaries.

1. Safety is always the number one priority. Do not implement GRP strategies or take actions that will unduly jeopardize public, worker, or personal safety.
2. Notify local public health and safety personnel.
3. Notify any dams downstream of the spill location.
4. Control and contain the source of the spill; mobilize resources to the spill location. Source control and containment are always a higher priority than GRP strategy implementation.
5. Determine the priority or order GRP strategies should be implemented based on the location of the spill or area affected. Priorities based on Potential Spill Origin Points are included in this chapter and should be used unless the situation or circumstances dictate otherwise (see Section 4.3.2).
6. As response resources become available, implement the GRP Strategies in order of priority.
7. In Washington State, if strategy implementation reduces, interrupts, or diverts the flow of water in streams, including the installation of a culvert block or underflow dam, an Emergency HPA must be obtained from WDFW (24-hour pager: 360/534-8233).

4.3.2 – Strategy Priorities based on Potential Spill Origin Points: The following tables provide the strategy implementation order for Potential Spill Origin Points along the Skykomish River and its tributaries; points SKY-A through SKY-H. These points are graphically displayed on area overview map (Figure 4.7) and sector maps, symbolized as red boxes. In establishing response priorities, or selecting an appropriate Spill Origin Point, the downstream movement of spilled oil and the time it takes to mobilize response resources and deploy boom must always be considered. Generally, GRP strategies should first be implemented downstream, well beyond the furthest extent of the spill, and then continued upstream towards the spill source.

WRIA 7 Geographic Response Plan (Skykomish – Ch. 4b)

“Source control and containment are always a higher priority than GRP strategy implementation.”

Skykomish River

SKY 3.1

Location	47.832719, -121.995562	Monroe, WA
Strategy Objective	Deflection	Deflect to keep oil from entering channels on river right.
Implementation	High Flow River Conditions Only: Using workboat, transport 400ft boom downstream 1.5 Miles fm boat ramp at Centennial Park (BL-SKY 4.7). Using line, pass end of boom to crew on shore at river right near the end of Hansen Rd (~N47.83412, W121.99495); shoreside crew anchors boom end to river bank. Boat crew then guides full extent of boom out fm shore & downstream to mid-river, anchoring remaining boom end in place. Use additional anchoring systems to keep boom secure in river. Use shoreside anchoring posts or trees to secure boom to river banks.	
Staging Area	Off-Site:	Stage at SA-SKY 4.7 (Skykomish River Centennial Park); launch boat from this location (BL-SKY 4.7).
Site Safety Note	Water Hazard; Slips, Trip, & Fall Hazards; Heavy foliage & trees; Use caution approaching river banks.	
Field Notes	Inform on-site property owner/manager before strategy implementation. This strategy is only to be used during high flow or high-high flow, when the channels fill with water. At lower water levels, the channels will remain relatively dry.	
Watercourse	River - Skykomish River	
Resources at Risk	Wetland habitat in channels	

Recommended Equipment

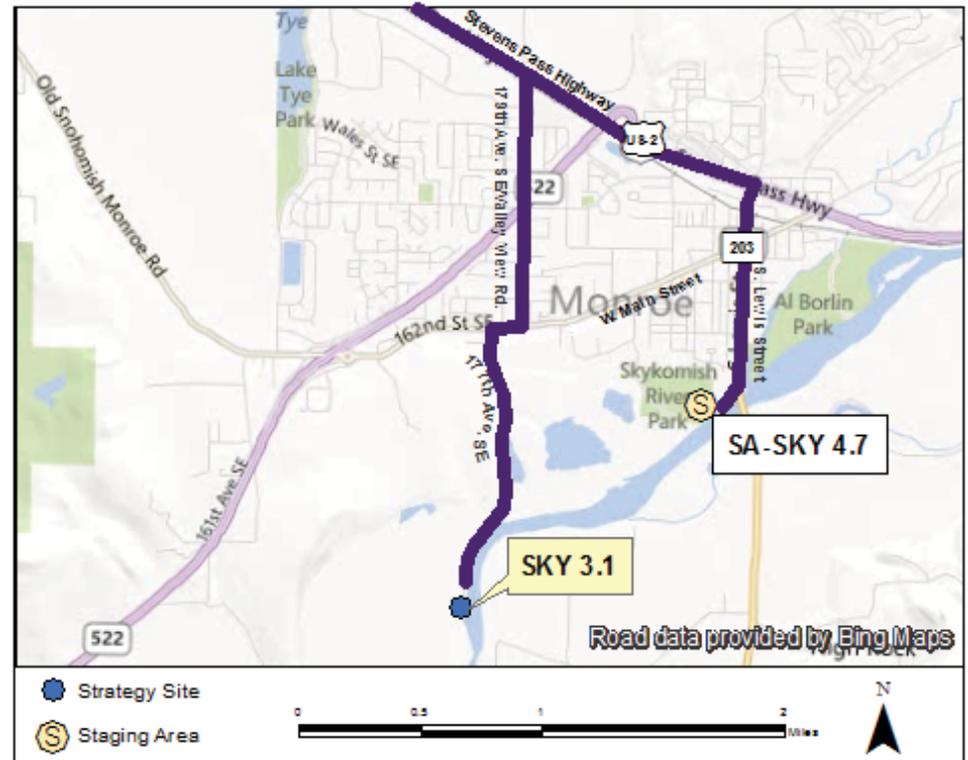

400	Feet	Boom - B3 (River Boom) or equivalent
1	Each	Workboat(s) - (jet drive recommended)
8	Each	Anchoring System(s) - (anchor, lines, floats)
400	Feet	Line - 3/8" poly line
2	Each	Heaving Line(s) and Line Throwing Device
1	Each	Towing Bridle(s) - (appropriately sized for boom)
2	Each	Heavy duty pruners (for hand removal of vegetation)
4	Each	Anchoring Post(s) - (shoreside)

Recommended Personnel

1	Supervisor(s)
4	Laborer(s)
1	Boat Operator(s)

Monroe, WA 98272

To SA-SKY 4.7:
South Lewis Street
Monroe, WA 98272

Driving Directions

To SKY 3.1 From US-2E/Stevens Pass Highway:

- Continue east on US-2/Stevens Pass Highway to Monroe, WA.
- Turn right onto 179th Avenue SE/Valley View Road.
- In one mile, turn right on W. Main Street.
- Turn left on 177th Avenue SE and follow for 1 1/4 miles.
- Park in gravel lot near bank project.

To SA-SKY 4.7 From US-2E/Stevens Pass Highway:

- Continue east on US-2/Stevens Pass Highway to Monroe, WA.
- Approximately 2/3 mile from US-2/WA-522 intersection, turn right on WA-203/S. Lewis Street.
- In 2/3 mile, just before WA-203 crosses the Skykomish River, turn right onto gravel road and keep left.
- Continue to parking area/boat ramps or follow road under bridge to Lewis Street Park.

Skykomish River

SKY 4.0

Location	47.839086, -121.980042	Monroe, WA
Strategy Objective	Collection	Collect oil moving downstream on river channel left.
Implementation	Using workboat, transport 550ft of boom downstream 0.7 Miles fm boat ramp at Centennial Park (BL-SKY 4.7). Strategy is on the left channel of river at this location, near end of 187th Ave SE. Secure boom to channel island (right side of river channel) about 350ft upstream from end of roadway (~N47.84003, W121.97952). Guide boom downstream & across to shoreside crew on channel left (end of 187th Ave SE). Shoreside crew anchors boom end to river bank and forms oil collection pocket. Use lines or additional anchoring systems to keep boom secure in river. Use shoreside anchoring posts or trees to secure boom to river banks.	
Staging Area	Off-Site:	Stage at SA-SKY 4.7 and launch boat from BL-SKY 4.7
Site Safety Note	Steep Banks; Water Hazard; Extreme caution required - trees and submerged debris in river	
Field Notes	"No Trespassing" sign on river left on east side of 187th Avenue SE. This side of the road is overgrown with thorny bushes and no access to slough.	
Watercourse	River Channel - Skykomish River	
Resources at Risk	Downstream habitat	

Recommended Equipment

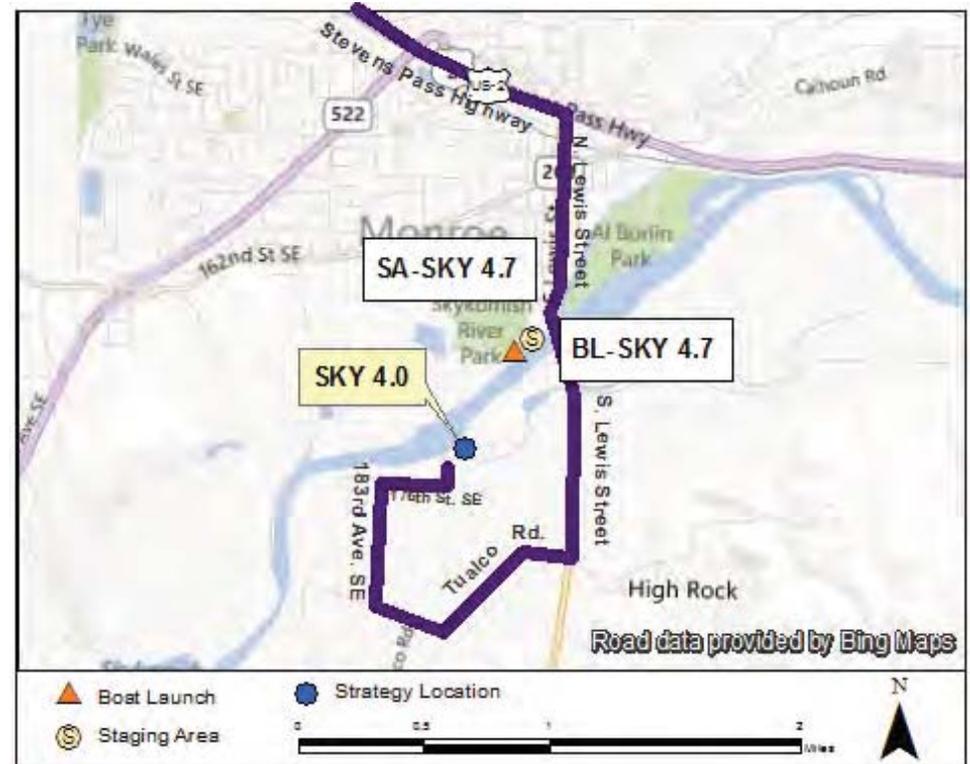

550	Feet	Boom - B3 (River Boom) or equivalent
1	Each	Workboat(s) - (jet drive recommended)
9	Each	Anchoring Post(s) - (shoreside)
2	Each	Anchoring Post Driver(s)
500	Feet	Line - 3/8" poly line
2	Each	Heaving Line(s)
1	Each	Towing Bridle(s) - (appropriately sized for boom)

Recommended Personnel

Driving Directions

From US-2E/Stevens Pass Highway:

- Continue east on US-2/Stevens Pass Highway to Monroe, WA.
- Approximately 2/3 mile past US-2/WA-522 intersection, turn right onto N. Lewis Street/WA-203S
- In 1 3/4 miles turn right onto Tualco Road.
- Turn right on 183rd Ave. SE/Sargent Road in 1/4 mile after Tualco Road becomes Tualco Loop Road.
- Turn right on 176th St. SE.
- Turn left on 187th Ave. SE and continue until road dead-ends.
- River access is to the left (west side) of the road.

For directions to SA-SKY 4.7 and BL-SKY 4.7, refer to Staging Area 2-Pagers (4C-1) and Boat Launch 2-Pagers (4D-1).

Skykomish River

SKY 23.2

Location	47.837026, -121.659679	Big Eddy State Park, Gold Bar, WA
Strategy Objective	Diversion, Collection	Divert oil moving downstream toward river right for collection.
Implementation	Use Hwy 2 Bridge to pass two 800ft lengths of line between crew on river right and river left, allowing line to span across the river downstream of bridge. Crew on river left connects the end of line to 800ft section of boom. Boom is brought upstream and across river by crew on river left using a power winch, and then secured to bank on downstream side of bridge. Second 800ft line is secured to boom near mid-point (~400ft) with a float, and used by crews on river right & left to adjust the boom angle. Crew on river right anchors downstream boom end to bank & forms oil collection pocket. Additional line systems may be needed.	
Staging Area	On-Site:	Big Eddy State Park, Stevens Pass Highway, Gold Bar, WA
Site Safety Note	Swift current down center of river, with small rapid downstream.	
Field Notes	Several large eddies in the area that could be used to benefit collection, depending on river conditions. Use caution when pulling lines under tension; only double-braided lines should be used.	
Watercourse	River at eddy - Skykomish River	
Resources at Risk	Downstream habitat	

Recommended Equipment

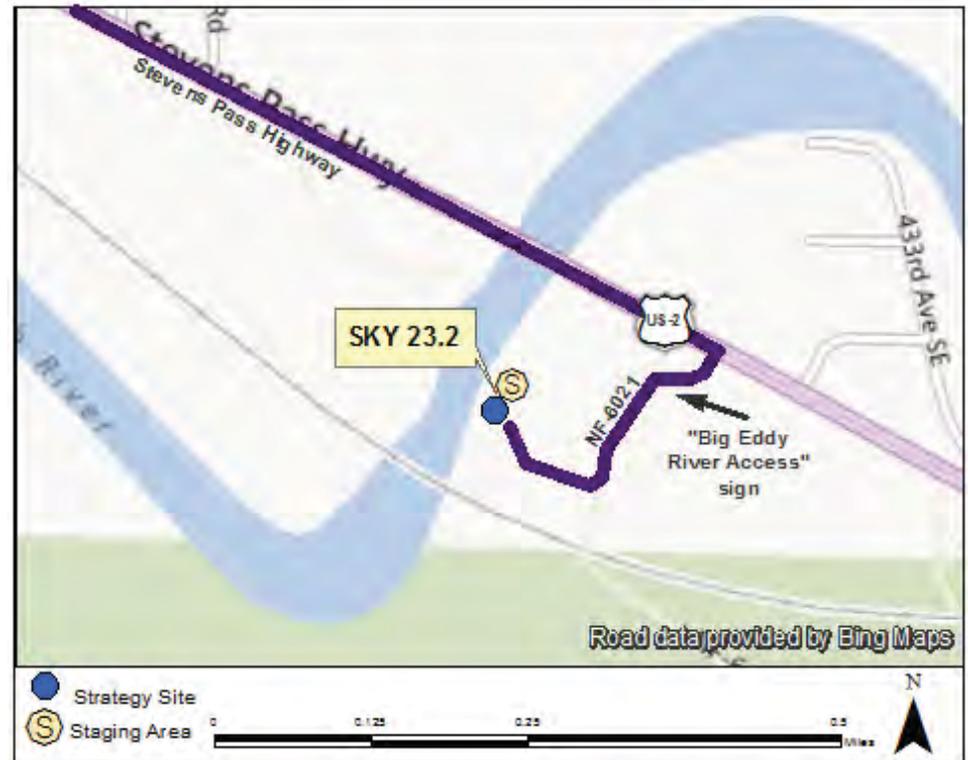

800	Feet	Boom - B3 (River Boom) or equivalent
1	Each	Vac Truck(s)
12	Each	Anchoring Post(s) - (shoreside)
1	Each	Towing Bridle(s) - (appropriately sized for boom)
2	Each	Heaving Line(s)
2500	Feet	Line - 1/2" poly line"
2	Each	Float (with line)
1	Each	Power Winch (Portable)

Recommended Personnel

1	Supervisor(s)
6	Laborer(s)

SKY 23.2 Photo: Facing N on River Left looking upstream toward Hwy 2 bridge and River Right.

Nearest Address

42819 Stevens Pass Highway
Gold Bar, WA 98251

Driving Directions

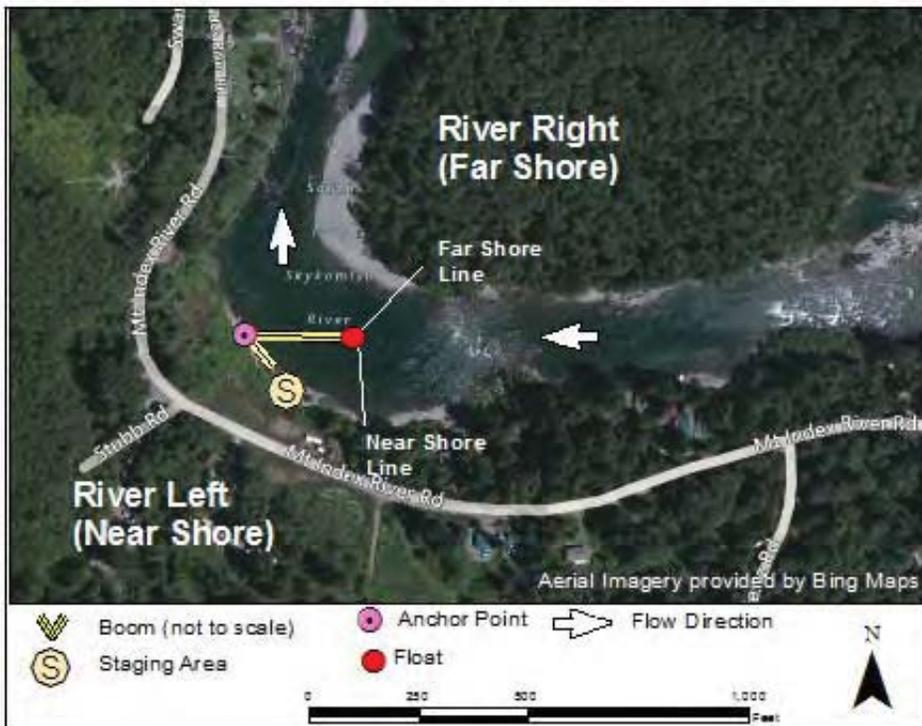

From US-2E/Stevens Pass Highway:

- Continue east on US-2/Stevens Pass Highway approximately 1.85 miles past Gold Bar.
- Take first right after bridge crossing (National Forest Rd. 6021). Sign will say "Big Eddy River Access".
- National Forest Rd. 6021 continues for 1/4 mile to site. Access river through parking lot.

South Fork Skykomish River

SKY-S 1.1

Location	47.804133, -121.566081	Index, WA
Strategy Objective	Collection	Divert oil to river left for collection.
Implementation	Use shoreside anchor posts to secure end of 300ft section of boom to shore on river left and form collection pocket. Attach float to remaining boom end. Secure end of a 500ft length of line & 300ft length of line to boom end with float. Use hand-launch workboat to transport crew & other end of 500ft line across to river right; keep 300ft length of line on river left. Move lines on river right & left upstream & pull tension on the boom (hand/power winched may be needed). Once deployed, adjust boom angle using the lines, as appropriate for river speed & conditions. Additional line systems may be needed to keep boom secure in river.	
Staging Area	On-Site:	Open area owned by Mt. Index Riversites with paths to river's edge.
Site Safety Note	Field may become muddy during rainy weather. Vacuum truck and vehicles use caution when staging.	
Field Notes	Private Property: Mt. Index Riversites. Easy access to the river from Mt. Index River Road. The river widens and slows in this area.	
Watercourse	River - South Fork Skykomish River	
Resources at Risk	Downstream habitat	

Recommended Equipment

300	Feet	Boom - B3 (River Boom) or equivalent
1	Unit	Vacuum Truck and Driver
1	Each	Boom Float
2	Each	Towing Bridle(s) - (appropriately sized for boom)
1000	Feet	Line - 3/8" poly line" (w/ safety clasps)
8	Each	Anchoring Post(s) - (shoreside)
2	Each	Anchoring Post Driver(s)
1	Each	Workboat(s) - (hand-launch)

 Index, WA

Driving Directions

From US-2E/Stevens Pass Highway:

- Continue east on Stevens Pass Highway to Index, WA.
- Turn right at Mt. Index River Road, just before US-2E crosses the South Fork of the Skykomish.
- Site will be on left approximately 1 mile from US-2E/Mt. Index River Road intersection.

South Fork Skykomish River

SKY-S 6.9

Location	47.773692, -121.49482	Baring, WA
Strategy Objective	Collection	Collect oil to keep it from continuing downstream.
Implementation	Use shoreside anchor posts to secure end of 500ft section of boom to shore on river right & form collection pocket. Attach 500ft line to remaining boom end. Attach float & two (tending) lines near boom's mid-point. Use hand-launch workboat to transport crew, 500ft line, and one tending line upstream and across to river left. On river left, use 500ft line to pull boom out into river and upstream; hand or power winch needed. Secure boom to bank on river left using anchoring posts or trees. Secure tending lines to river bank once the desired boom angle has been achieved. Use additional line systems to keep boom secure in river.	
Staging Area	On-Site:	Stage on river right at old house.
Site Safety Note	Two-foot drop down to river bank. Shore is soft and sandy and may be hazardous for a vac truck.	
Field Notes	River access, but overgrown in places. May need pruners for vegetation removal. No access on opposite bank.	
Watercourse	River - South Fork Skykomish River - Width: 76 Yards (Variable) - Depth: Shallow to hole in middle ~20 feet deep	
Resources at Risk	Downstream habitat	

Recommended Equipment

300	Feet	Boom - B3 (River Boom) or equivalent
1	Each	Workboat(s) - (hand-launch)
1	Each	Heavy duty pruners (for hand removal of vegetation)
2	Each	Anchoring System(s) - (anchor, lines, floats)
1	Each	Vac Truck(s)
400	Feet	Line - 3/8" poly line

Recommended Personnel

- Turn right at 634th Place NE , immediately after "Entering Baring" sign.
- Turn right onto NE 196th Street.
- Arrive at 63088 NE 196th Street, Baring, WA 98224.

South Fork Skykomish River

SKY-S 15.2

Location	47.711754, -121.34174	Monroe, WA
Strategy Objective	Collection	Collect oil moving downstream on the Skykomish River from upstream source.
Implementation	Use shoreside anchor posts to secure end of 300ft section of boom to shore on river right & form collection pocket. Attach 400ft line to remaining boom end. Attach float & two (tending) lines near boom's mid-point. Use hand-launch workboat to transport 400ft line and one tending line upstream and across to crew on river left. On river left, use 400ft line to pull boom out into river and upstream; hand or power winch needed. Secure boom to bank on river left using anchoring posts or trees. Secure tending lines to river bank once the desired boom angle has been achieved. Use additional line systems to keep boom secure in river.	
Staging Area	On-Site:	Stage Vac-Truck on shoulder of Highway 2.
Site Safety Note	Roadway Hazard; Water Hazard; Steep Bank; Slips, Trips, Falls.	
Field Notes	Due to height of roadway above river, a booster pump may be necessary to enhance vacuum truck suction capability. Temporary use of shoulder may be required to implement strategy; at minimum follow WADOT work zone traffic control guidelines.	
Watercourse	River - Skykomish River - Width 180 feet (Variable)	
Resources at Risk	Downstream habitat	

Recommended Equipment

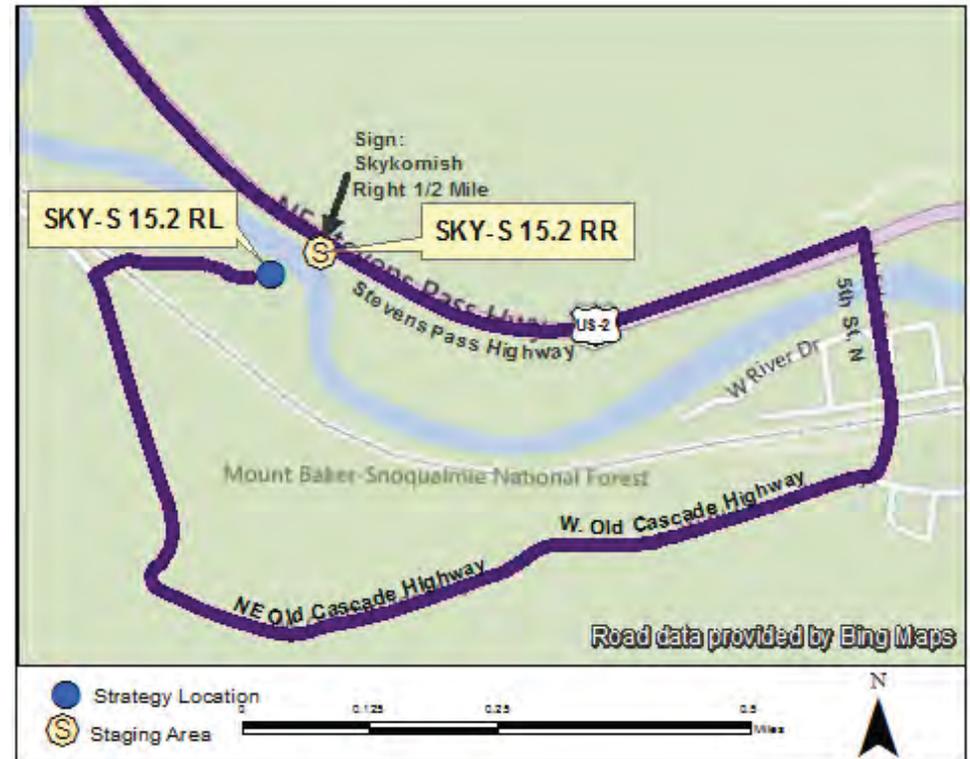

300	Feet	Boom - B3 (River Boom) or equivalent
1	Each	Workboat(s) - (hand-launch)
1000	Feet	Line - 1/2" poly line"
2	Unit	Hand Bridle(s) and Towing Bridle

Stevens Pass Highway
Snoqualmie National Forest
Skykomish, WA 98288

Driving Directions

From US-2E/Stevens Pass Highway:

Near Shore Crew:

- Travel southeast on Stevens Pass Highway.
- Approximately 6.5 miles past Baring, WA, exit onto shoulder at "Skykomish- Right 1/2 Mile" sign.

Far Shore Crew:

- Travel southeast on Stevens Pass Highway to Skykomish, WA.
- Turn right onto 5th Street N. and cross bridge.
- Take a right on E Railroad Ave. and then immediate left to stay on 5th Street N.
- Take a right on W. Cascade Highway and follow for approximately 1 mile.
- Take a right onto dirt road. Follow road east 0.15 miles across railroad tracks toward river.

South Fork Skykomish River

SKY-S 16.0

Location	47.710873, -121.360549	Skykomish, WA
Strategy Objective	Collection	Use access point to collect oil and keep it from continuing downstream.
Implementation	Use shoreside posts to secure end of 300ft boom to bank on river left (4th St N). Attach 300ft line to remaining boom end. Attach a float & two (tending) lines at point on boom ~100ft fm the end that's secured to shore. Walk 300ft line & one tending line across bridge to river right. Use shoreline to walk other tending line upstream on river right. Use 400ft line to pull boom out into river & downstream; winch likely needed. Secure boom to bank on river right using posts or trees, & form collection pocket. Secure tending lines to river banks once desired boom angle is achieved. Use additional lines to keep boom secure in river.	
Staging Area	On-Site:	Stage on south side of bridge.
Site Safety Note	Steep bank with boulders; use caution approaching river.	
Field Notes	Several eddies could be used to collect based on current and conditions.	
Watercourse	River -Skykomish River	
Resources at Risk	Downstream habitat	

Recommended Equipment

550	Feet	Boom - B3 (River Boom) or equivalent
1000	Feet	Line - 3/8" poly line
8	Each	Anchoring System(s) - (anchor, lines, floats)
4	Each	Anchoring Post(s) - (shoreside); (2) Anchoring post Drivers

- Arrive at staging area on left (facing south).

Sultan River

SUL 0.2

Location	47.861103, -121.820891	Sportsman Park, Sultan, WA
Strategy Objective	Collection	Collect oil on Sultan River before it enters the Skykomish River.
Implementation	Use shoreside anchor posts to secure end of 350ft section of boom to shore on river right & form collection pocket. Attach 400ft line to remaining boom end. Attach float & 2 tending lines near boom mid-point. Use line throwing device or hand-launch boat to transport 400ft line & one tending line upstream and across to crew on river left. On river left, use 400ft line to pull boom out into river and upstream; hand or power winch needed. Secure boom to bank on river left using anchoring posts or trees. Secure tending lines to river bank once desired boom angle has been achieved. Use additional lines to keep boom secure in river.	
Staging Area	On-Site:	WDFW Park with trailerable boat ramp.
Site Safety Note	Swift current at confluence.	
Field Notes	There is a trail along river from behind Main St. that provides access to river left, but vegetation removal may be necessary.	
Watercourse	River at confluence - Sultan River	
Resources at Risk	Downstream habitat	

Recommended Equipment

300	Feet	Boom - B3 (River Boom) or equivalent
1	Each	Workboat(s) - (hand-launch)
1000	Feet	Line - 3/8" poly line

- Approximately 0.4 miles past Old Owen Road, just before bridge crossing, turn left onto Albion Street.
- Sportsman Park parking lot and boat launch are on right.

Sultan River

SUL 2.6

Location	47.888751, -121.834517	Sultan, WA
Strategy Objective	Collection	Collect to keep oil from entering Skykomish River.
Implementation	Use anchor posts to secure end of 300ft section of boom to shore on river left and form collection pocket. Attach 300ft line to remaining boom end. Attach float & 2 tending lines near boom's mid-point. Use hand-launch workboat to transport crew and 300ft line upstream (~250ft) to river right near N47.88937, W121.83429. Use line to pull boom out into river and upstream; hand or power winch needed. Secure boom to bank using posts. Once desired boom angle is achieved, secure tending lines to river banks using posts or trees at points near perpendicular to boom. Notify private property owners. Use additional lines as needed.	
Staging Area	On-Site:	Snohomish PUD alternate boat access point.
Site Safety Note	Watch for submerged branches and rocks when crossing the Sultan River.	
Field Notes	Site is the Snohomish PUD alternate boat access site. Property across the river is privately owned.	
Watercourse	River - Sultan River	
Resources at Risk	Downstream habitat	

Recommended Equipment

350	Feet	Boom - B3 (River Boom) or equivalent

Driving Directions

From US-2E/Stevens Pass Highway:

- Continue east on US-2/Stevens Pass Highway to Sultan, WA.
- Approximately 0.15 miles from US-2 bridge, turn left onto 3rd Street, and take an immediate left on Main Street.
- After 0.1 mile, Main Street continues right onto 1st Street. Follow 1st Street for 0.85 miles.
- Turn left on Trout Farm Road, across from housing development.

Location	47.711343, -121.153107	Near Stevens Pass, WA
Strategy Objective	Collection	Collect oil on Tye River spilled from upstream source
Implementation	Use heaving line to transfer a larger line from bridge to crew upstream on river left. From bridge, attach larger line to 100ft boom end & feed boom fm bridge into river as crew on river left pulls tension, ultimately securing boom end to bank using anchor posts. Attach float on remaining boom end and continue to feed boom fm bridge into river towards river right until all boom is in river. Crew downstream of bridge on river right must use hook or heaving line to snag float & pull it to bank. River right secures boom end to shore and forms collection pocket. Stuff collection pocket with sorbent boom if strategy is to be left unattended.	
Staging Area	On-Site:	Highway access with space on river left for parking and staging.
Site Safety Note	Swift current, steep bank, and slippery moss-covered boulders. Use caution when descending down bank from highway.	
Field Notes	Sorbent boom recommended; sorbent pads may escape the boom and be deposited downstream. If product flow is heavy, the use of a vacuum truck should be considered but the flow of the river may be too fast or turbid to prevent some entrainment.	
Watercourse	River - Tye River	
Resources at Risk	Downstream habitat	

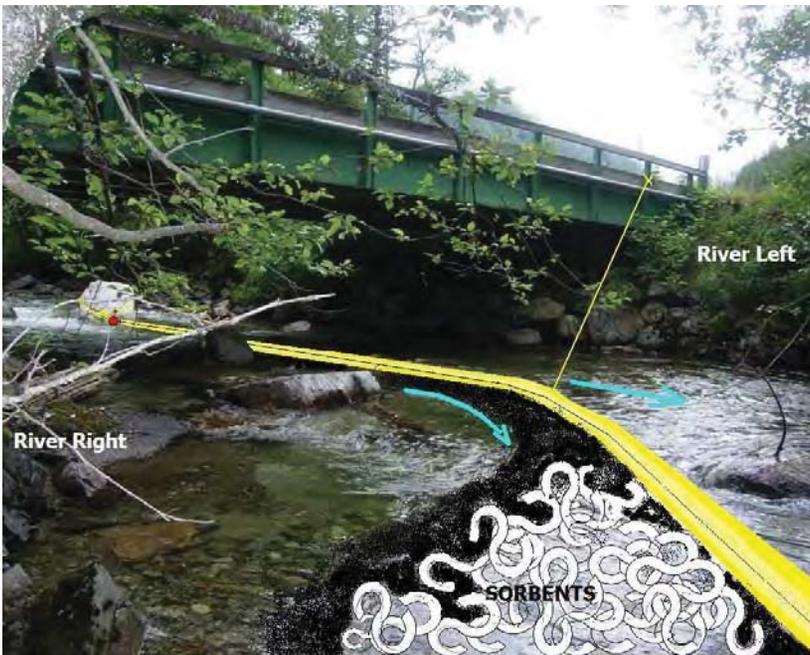

Recommended Equipment

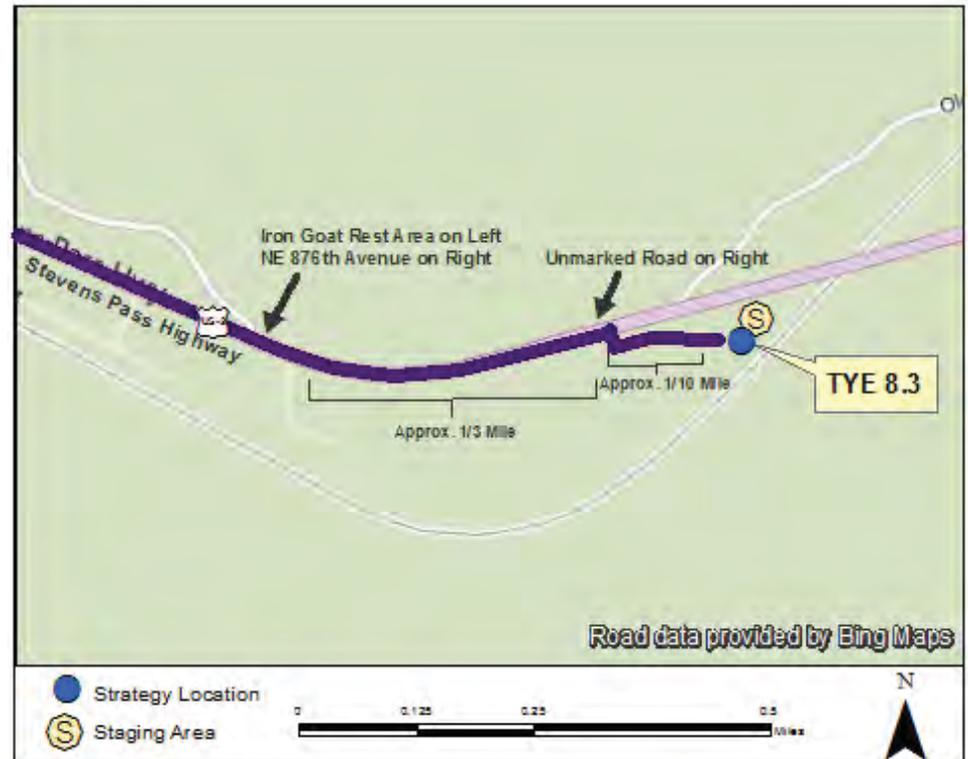

100	Feet	Boom - B3 (River Boom) or equivalent
2	Each	Heaving Line(s)
200	Feet	Line - 3/8" poly line
2	Each	Towing Bridle(s) - (appropriately sized for boom)
1	Each	Come-Along Winch or Power Winch

- Continue east on US-2/Stevens Pass Highway to Monroe, WA.
- Approximately 2/3 mile from US-2/WA-522 intersection, turn right on US-203/S. Lewis Street.
- In 2/3 mile, just before US-203 crosses the Skykomish River, turn right onto gravel road and keep left.
- Continue to parking area/boat ramps or follow road under bridge to Lewis Street Park.

Sportsman Park

BL-SUL 0.1

Boat Launch Location

Location:	47.861103, -121.820891	Sultan, WA
Comments:	WDFW Park with boat ramp. Extreme caution required on-site due to swift current and dangerous undertow associated with confluence.	

Location Information:

<u>Asset</u>	<u>Type/Status</u>	<u>Amount/Number</u>
Boat Ramp	Yes	2
Boat Ramp Type	Dirt/Gravel	
Boat Dock	No	
Restrooms	No	
Power	No	
Water	No	
Parking (car)	Yes	20
Parking (trailer)	Yes	20
Waste Disposal	No	
Telephones	No	
Cell Phone Coverage	Unknown	
Estimated Lot Size	SqFt	60000
Lot Cover (primary)	Dirt/Gravel	
Covered Spaces	Yes	1
User Fee	Yes	WDFW Use Permit

SUL 0.2

Boat Launch Location

BL-SUL 0.1 Photo: Facing SE on river right looking under Hwy 2 bridge toward railroad bridge, river left, and confluence of Sultan and Skykomish rivers.

Site Contact Information

WDFW Region 4
16018 Mill Creek Blvd.
Mill Creek, WA 98012
(425) 775-1311

Nearest Address:

Sportsman Park
Albion Street
Sultan, WA 98294

Driving Directions:

From US-2E/Stevens Pass Highway:

- Continue east on US-2E/Stevens Pass Highway to Sultan, WA.
- Approximately 0.4 miles past Old Owen Road and just before bridge crossing, turn left onto Albion Street.
- Sportsman Park parking lot and boat launch are on right.

WRIA 7

Geographic Response Plan

Chapter 5 – Shoreline Countermeasures

5.1 - Chapter Introduction

This Chapter is intended to serve as a tool for countermeasure contingency planning and implementation for shorelines within the WRIA 7 area. Shoreline countermeasure processes evolve to reflect increasingly efficient treatment techniques. Accordingly, the following information may change as new information is developed. At this time, complete shoreline-type mapping has not been performed for WRIA 7. Until this effort is undertaken, photographs representing example shoreline types in the geographic area are provided on the following pages. These shoreline types can be matched with the shoreline countermeasures matrices in Appendix 5A to help determine what response cleanup action is appropriate for the type of oil spilled.

5.2 - Oil Countermeasures Matrices

Shoreline countermeasures after an incident are a critical element in determining the environmental impact, injury, and damages from spilled oil. Local response organizations and agencies have developed mechanisms for identifying shorelines requiring treatment, establishing treatment priorities, monitoring the effectiveness and impacts of treatment, and for resolving problems as the treatment progresses. Ultimately, the Northwest Area Committee will develop a manual and a series of matrices as tools for shoreline countermeasures in the Pacific Northwest. The Northwest Area Shoreline Countermeasures Manual and Matrices will be included as a technical appendix to the Northwest Area Contingency Plan (Section 9420). The Northwest Area Contingency Plan can be obtained electronically from the RRT/NWAC web site at <http://www.rrt10nwac.com>.

Each section of the shoreline countermeasures manual will be adapted to the specific environments, priorities, and treatment methods appropriate to the planning area. These elements will provide the information needed to select cleanup methods for specific combinations of shoreline and oil types.

5.3 - Shoreline Type Photos

Photographs of typical shorelines found in the WRIA 7 GRP area are contained in Appendix 5B of this Chapter. A full list of shoreline types can be found within the tables in Appendix 5A. Additional information on shoreline type classifications can be found in the Shoreline Assessment Job Aid available as a publication on National Oceanographic and Atmospheric Administration's web site at <http://response.restoration.noaa.gov>.

Shoreline Countermeasures Matrices: Table 5A-1

Very Light Oils

Jet fuels, Gasoline

- Highly volatile (should all evaporate within 1-2 days)
- High concentration of toxic (soluble) compounds
- Localized, severe impacts to water column and shoreline resources
- Duration of impact is a function of the resource recovery rate
- No dispersion necessary

Shoreline Type Codes

- 1** - Exposed rock shores and vertical, hard man-made structures
- 2** - Exposed wave-cut platforms
- 3** - Fine to medium grained sand beaches and steep
- 4** - Course grained sand beaches
- 5** - Mixed sand and gravel beaches, including artificial fill containing a range of grain size and material
- 6A** - Gravel beaches - pebbles to cobble
- 6B** - Gravel beaches - cobbles to boulders

- 6C** - Exposed rip rap
- 7** - Exposed tidal flat
- 8A** - Sheltered vertical rock shores and vertical, hard man-made structures (seawalls, docks)
- 8B** - Sheltered rubble slope
- 9A** - Sheltered sand and mud flats
- 9B** - Sheltered vegetated low bank
- 10** - Marshes

R = Recommend (May be Preferred Alternative)

C = Conditional (Refer to NW Shoreline Countermeasures Manual – NWACP Section 9640)

Items not marked “R” or “C” are not applicable or not generally recommended

Labels marked * Required to follow approved process defined in [National Contingency Plan](#) and [NW Area Contingency Plan](#)

Permit Requirements: See [NWACP Section 9320](#) - Northwest Area Permit and Consultation Guide

This countermeasure advisability matrix is only a general guide for removal of oil from shoreline substrates. It must be used in conjunction with the entire Shoreline Countermeasures Manual in the NW Area Contingency Plan plus field observations and scientific advice. The countermeasures listed are not necessarily the best under all circumstances, and any listed technique may need to be used in conjunction with other techniques (including ones not listed herein). The Federal On-Scene Coordinator (FOSC), or the state OSC operating with the FOSC's authorization, has the responsibility for and the authority to determine which countermeasure(s) are appropriate for various situations encountered. Selection of countermeasures is based on the degree of oil contamination, shoreline type, and the presence of sensitive resources.

Shoreline Countermeasures Matrices: Table 5A-2

Light Oils

**Diesel, No. 2 Fuel Oils,
Light Crude Oils**

- Moderately volatile; will leave residue (up to 1/3 of spilled amount)
- Moderate concentrations of toxic (soluble) compounds
- Long-term contamination of intertidal resources possible
- Potential for subtidal impacts (dissolution, mixing, sorption onto suspended sediments)
- No dispersion necessary
- Cleanup can be very effective

Shoreline Type Codes

- 1 - Exposed rock shores and vertical, hard man-made structures
- 2 - Exposed wave-cut platforms
- 3 - Fine to medium grained sand beaches and steep
- 4 - Course grained sand beaches
- 5 - Mixed sand and gravel beaches, including artificial fill containing a range of grain size and material
- 6A - Gravel beaches - pebbles to cobble

This countermeasure advisability matrix is only a general guide for removal of oil from shoreline substrates. It must be used in conjunction with the entire Shoreline Countermeasures Manual in the NW Area Contingency Plan plus field observations and scientific advice. The countermeasures listed are not necessarily the best under all circumstances, and any listed technique may need to be used in conjunction with other techniques (including ones not listed herein). The Federal On-Scene Coordinator (FOSC), or the state OSC operating with the FOSC’s authorization, has the responsibility for and the authority to determine which countermeasure(s) are appropriate for various situations encountered. Selection of countermeasures is based on the degree of oil contamination, shoreline type, and the presence of sensitive resources.

Shoreline Countermeasures Matrices: Table 5A-3

Medium Oils

Most Crude Oils & Some Heavily Weathered Light Crude Oils

- About 1/3 will evaporate within 24 hours
- Maximum water-soluble fraction is 10-100 parts per million (ppm)
- Oil contamination of intertidal areas can be severe and long-term
- Impact to waterfowl and fur-bearing mammals can be severe
- Chemical dispersion is an option within 1-2 days
- Cleanup most effective if conducted quickly

Shoreline Type Codes

- 1** - Exposed rock shores and vertical, hard man-made structures
- 2** - Exposed wave-cut platforms
- 3** - Fine to medium grained sand beaches and steep
- 4** - Course grained sand beaches
- 5** - Mixed sand and gravel beaches, including artificial fill containing a range of grain size and material
- 6A** - Gravel beaches - pebbles to cobble
- 6B** - Gravel beaches - cobbles to boulders

- 6C** - Exposed rip rap
- 7** - Exposed tidal flat

This countermeasure advisability matrix is only a general guide for removal of oil from shoreline substrates. It must be used in conjunction with the entire Shoreline Countermeasures Manual in the NW Area Contingency Plan plus field observations and scientific advice. The countermeasures listed are not necessarily the best under all circumstances, and any listed technique may need to be used in conjunction with other techniques (including ones not listed herein). The Federal On-Scene Coordinator (FOSC), or the state OSC operating with the FOSC’s authorization, has the responsibility for and the authority to determine which countermeasure(s) are appropriate for various situations encountered. Selection of countermeasures is based on the degree of oil contamination, shoreline type, and the presence of sensitive resources.

Shoreline Countermeasures Matrices: Table 5A-4

Heavy Oils

Crude Oils, Intermediate Fuel Oils, Bunker C, Heavily Weathered Medium Crude Oils

- Heavy oils with little or no evaporation or dissolution
- Water-soluble fraction likely to be <10 ppm
- Heavy contamination of intertidal areas likely
- Severe impacts to waterfowl and fur-bearing mammals (coating and ingestion)
- Long-term contamination to sediments possible
- Weathers very slowly
- Dispersion seldom effective
- Shoreline cleanup difficult under all conditions

Shoreline Type Codes

WRIA 7

Geographic Response Plan

Appendix 5B – Shoreline Type Photographs

Shoreline Type 1A: Exposed rocky banks

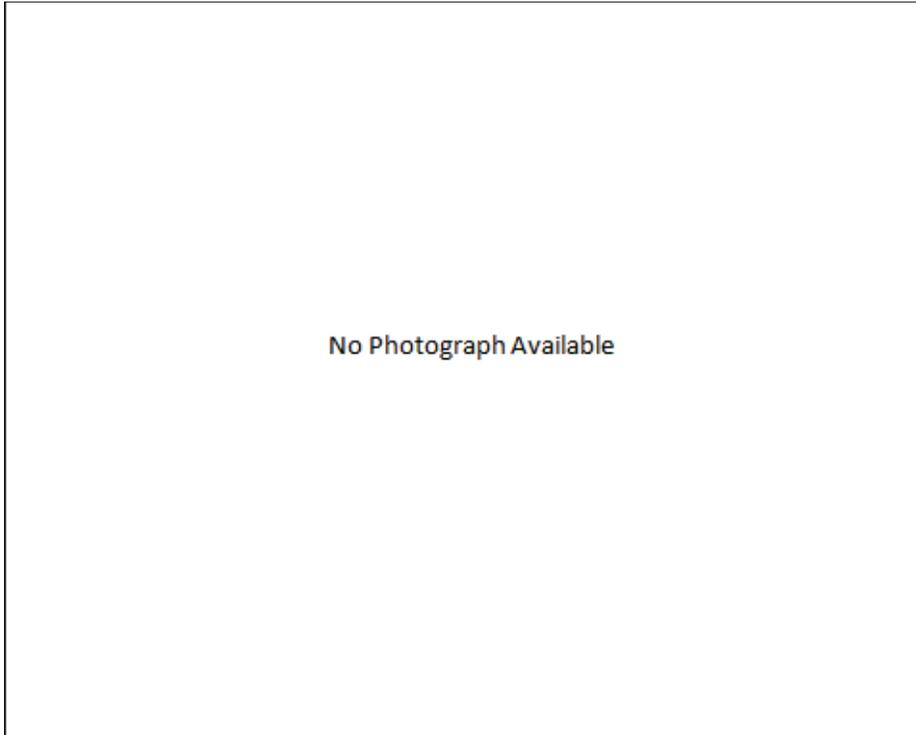

Shoreline Type 1B: Exposed, solid man-made structures

Shoreline Type 1C: Exposed rocky cliffs with boulder talus base

Shoreline Type 2A: Rocky shoals; bedrock ledges

Shoreline Type 3B: Exposed, eroding banks in unconsolidated sediments

Shoreline Type 4: Sandy bars and gently sloping banks

Shoreline Type 5: Mixed sand and gravel bars and gently sloping banks

Shoreline Type 6A: Gravel bars and gently sloping banks

Shoreline Type 6B: Riprap

Shoreline Type 8B: Sheltered, solid man-made structures

Shoreline Type 9B: Vegetated low banks

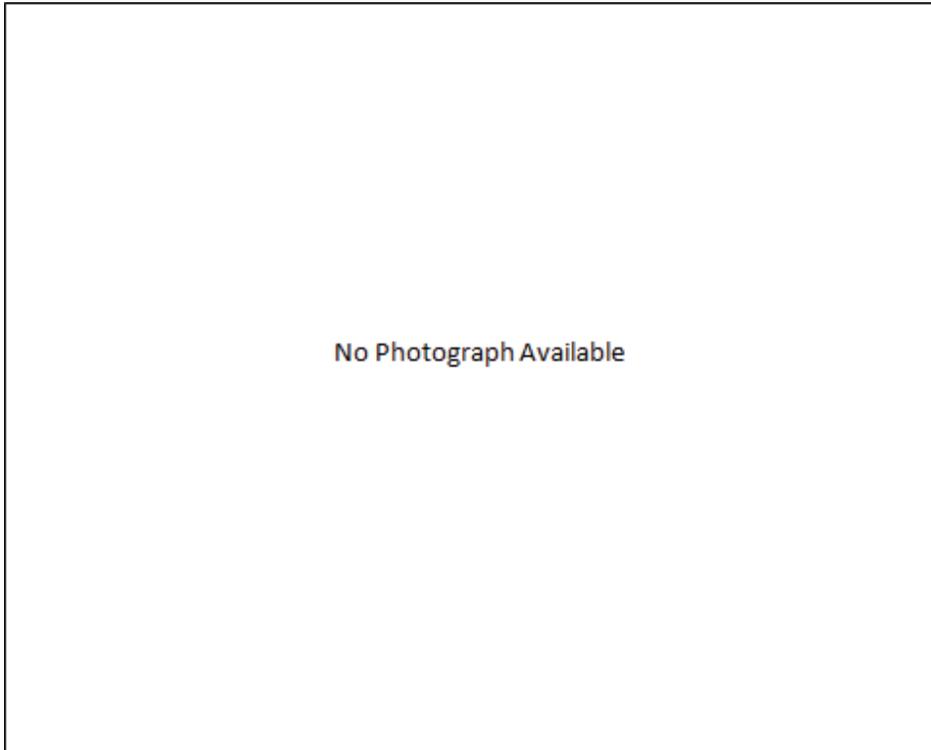

Shoreline Type 10B: Freshwater marshes

Shoreline Type 10C: Swamps

Shoreline Type 10D: Srub-shrub wetlands

WRIA 7

Geographic Response Plan

Chapter 6 – Resources at Risk

6.1 Chapter Introduction

This chapter highlights some of the more sensitive resources at risk within the GRP region that may be affected by an oil spill. This material is presented with enough detail to give general information about the area during the first phase of a spill response. During an actual incident, more information about resources at risk will be available from the Environmental Unit in the Planning Section.

The information given in this chapter is intended for use in:

- Giving resource at risk “context” to responders and clean up personnel in the first stages of a response.
- Briefing ICS personnel unfamiliar with the general natural resource concerns in the GRP area.
- Providing background material for media presentations and public outreach associated with a spill incident.

This summary of sensitive resources is followed by general information related to spill response.

6.2 Natural Resources at Risk - Summary

The WRIA 7 GRP (Snohomish/Skykomish/Snoqualmie River basins) affords a wide variety of aquatic, riparian, and upland habitats. These varied habitats support a complex diversity of wildlife species, including large and small mammals; passerine birds, raptors, upland birds, and waterfowl; reptiles; and amphibians. Some species are resident throughout the year; others are migratory either within the subbasin or, in many cases, seasonally migrate outside the subbasin. Populations of certain species are tenuous and their future presence in the subbasin will require improved information and decisive management actions. Many wildlife species found in the subbasin are classified as threatened, endangered, sensitive, or of special concern under the federal Endangered Species Act or under Washington State guidelines.

Sensitive species that may occur within this area, at some time of year, include the following federal and, or state listed species. These are designated as Federal Endangered (FE), Federal Threatened (FT), Federal Candidate (FC), Federal Species of Concern (FCo), State Endangered (SE), State Threatened (ST), State Candidate (SC), State Sensitive (SS).

Birds: Bald eagle [FCo/SS], Golden eagle [SC], Peregrine falcon [FCo/SS], Northern spotted owl [FT/SE], Purple martin [SC]

Mammals: Wolverine [FC/SC]

Fish: Bull trout [FT/SC], Coastal Cutthroat trout [FCo], Pacific steelhead [FT], Puget Sound Chinook salmon [FT/SC], Pacific lamprey [FCo], River lamprey [FCo/SC], Western brook lamprey [FCo]

Reptiles: Pacific Pond Turtle [FCo/SE],

6.2.1 - General Resource Concerns

6.2.1a Habitats:

- The brackish ***tidal marshes*** found in the northern part of the GRP serve a number of important ecological functions and support large numbers of benthic and epibenthic organisms. Many species of birds and fish utilize these marshes as foraging areas.
- The ***brackish sloughs and backwater channels*** provide feeding and resting areas for waterfowl and herons and are rearing areas for juvenile fish.
- ***Wetlands*** in this region also include tidal freshwater areas along the main stem of the Snohomish and forested fresh water swamps along the edges and upper end of the estuary. All wetland types support a diverse array of bird, insect and fish and wildlife species.
- ***Islands*** provide important nesting habitat for a variety of bird species, as well as habitat for a variety of mammals. Gravel bars provide spawning habitat for Chinook salmon.
- ***Stream mouths*** are concentration areas for anadromous fish and are feeding areas for a variety of marine birds.
- ***Riparian vegetation*** is heavily used by a variety of wildlife and may also improve nearshore fish habitat.
- ***Human-made structures*** such as pilings, rock jetties or log rafts may be used as roosting or nesting areas for a variety of marine birds and raptors.

6.2.1b Fish & Shellfish:

- Juvenile and/or adult ***salmonids*** (including ***Chinook [FT/SC]***, ***coho***, ***chum***, ***pink*** (even and odd year), ***sockeye***, ***cutthroat trout*** (resident and coastal), ***steelhead [FT]***, and

bull trout [FT/SC] are present in the river system throughout the year. Thousands of juvenile salmonids use estuarine waters as a rearing and foraging area each year as they prepare for migration to the ocean. Returning adult salmonids support significant tribal, commercial and recreational fisheries.

- **Anadromous and Euryhaline fish** (other than salmonids) in this region include: **pacific lamprey [FCo], river lamprey [FCo], green sturgeon [FT], white sturgeon,** and the **starry flounder**.
- Resident fish present year-round in freshwater portions of the river include **rainbow trout, large scale sucker, largemouth bass, western brook lamprey, mountain whitefish, sculpin, three spine stickleback, yellow perch, eastern brook trout, pumpkinseed, crappie, pike minnow, peamouth,** and **sunfish**.

6.2.1c Wildlife:

- **Bald eagles [ST]** and **Great Blue herons** are nesting residents and may be found year-round throughout the region. There are several **Peregrine falcon** nests in the region; this species is more commonly found as a winter and spring visitor to the lower estuary but is also present in the upper Skykomish basin.
- The lower reach of Snohomish River (in the vicinity of Ebey Island) supports significant **waterfowl concentrations** from fall through spring. Hundreds to thousands of geese, swans and dabbling ducks may occupy this region during this period. Both resident and migratory waterfowl heavily utilize the islands, sloughs, wetlands and adjacent uplands of the region from fall through spring. The islands in this sub-region also provide nesting habitat for resident waterfowl.
- The Snohomish River estuary supports migrating **shorebirds** such as dunlin and sandpipers during migration periods (April-October).
- The upper reaches of the Skykomish River and its tributaries provide breeding habitat during the winter and spring months for **harlequin ducks. Osprey, golden eagle [SC],** and **northern spotted owl [FT/SE]** are also found in this same general area.
- **Resident and migratory songbirds** heavily utilize riparian habitats year-round and are susceptible to oiling if riparian vegetation and shorelines become contaminated.
- **Mammals** common to the region include deer, elk, beaver, river otter, mink and raccoon. **Wolverine [FC/SC]** and **mountain goat** are also present in the upper Skykomish basin.

6.2.2 - Specific Geographic Areas of Concern

Snohomish River, RM 0.6 (downstream of Ferry Baker Island) to RM 20.5 (Hwy 522 bridge)

This is the tidally influenced section of the river system. The lower section contains extensive wetlands and intertidal habitats that form rearing habitat for juvenile salmonids and concentration areas for migratory and wintering waterfowl. Riverside public lands in this reach include: Langus Riverfront Park, WDFW Spencer Island, Rotary Park, Field’s Riffle Park, Cady Park, Bob Heirman Wildlife Park, Lord Hill Regional Park.

Below is a table of restoration sites in WRIA 7 that are of specific concern during a response.

Project Name	latitude	longitude
Qwuloolt Marsh Restoration	48.044444	-122.156944
Union Slough Dike Breach	48.000000	-122.166666
Smith Island Estuarine Restoration Project	48.022309	-122.170029
Howarth Park and Snohomish County Beach Nourishment	47.963527	-122.241263

6.3 – Cultural Resources at Risk Summary

Culturally sensitive sites are present within the WRIA 7 GRP area. Due to the sensitive nature of this information, details regarding the location and type of cultural resources present are not included in this document. Information on Cultural and Historic Preservation provided in NWACP Section 4313 must be considered and should be followed during a response.

Washington Department of Archaeology and Historic Preservation (WDAHP) may assign a person to monitor cleanup operations, or provide a list of professional archeologists that can be contracted to monitor response activities.

Information on the location of culturally sensitive sites is maintained by WDAHP and made available to Washington Department of Ecology for oil spill preparedness and response planning. After the unified command is established, information related to specific archeological concerns will be coordinated through the Environmental Unit.

6.3.1 - Discovery of Human Skeletal Remains: Any human remains, burial sites, or burial-related materials that are discovered during a spill response must be treated with respect at all times.

- All work must be stopped immediately and the Incident Commander and Cultural Resource Specialist notified if any person monitoring work activities or involved in spill response believes that human skeletal remains have been discovered.
- The Incident Commander is responsible for taking appropriate steps to protect the discovery. The immediate area of discovery should be flagged. Vehicles and equipment must not be permitted to traverse the discovery site. In no case should further disturbance be performed prior to consultation with WDAHP. Exposed human remains should not be left unattended.
- The Incident Commander (or representative) must immediately report the discovery to WDAHP, local law enforcement (with jurisdiction), and the local coroner (with jurisdiction). The coroner (or medical examiner) will determine whether the discovery site is a crime scene or human burial.
- If the remains are determined to be non-Native American, or connected with criminal activity, local law enforcement will take charge of the discovery site and remains.
- If the remains are determined to be Native American not related to a crime scene, an archaeologist from the appropriate tribe, state archaeologist, and Incident Commander will confer on a treatment plan for the remains.

6.3.2 - Procedures for the Discovery of Cultural Resources: All work must be stopped immediately. The Incident Commander and Cultural Resource Specialist must be notified immediately if any person monitoring work activities or involved in a spill response believes that they have encountered cultural resources. The area covered by the work stoppage must be adequate enough to provide for the security, protection, and integrity of the material or artifact(s) discovered.

Prehistoric Cultural Resources:

(May include but not limited to any of the following items)

- Lithic debitage (stone chips and other tool-making byproducts)
- Flaked or ground stone tools
- Exotic rock, minerals, or quarries

- Concentrations of organically stained sediments, charcoal, or ash
- Fire-modified rock
- Rock alignments or rock structures
- Bone (burned, modified, or in association with other bone, artifacts, or features)
- Shell or shell fragments
- Petroglyphs and pictographs
- Fish weirs and traps
- Culturally modified trees
- Physical locations or features (traditional cultural properties)

Historic cultural material:

(May include any of the following items over 50 years old)

- Bottles, or other glass
- Cans
- Ceramics
- Milled wood, brick, concrete, metal, or other building material
- Trash dumps
- Homesteads, building remains
- Logging, mining, or railroad features
- Piers, wharves, docks, bridges, dams

If the Department of Archaeology and Historic Preservation (WDAHP) believes that the discovery is a cultural resource, the Incident Commander must take appropriate steps to protect the discovery site:

- The immediate area of the discovery site should be flagged. Vehicles or equipment must not be permitted to enter the discovery site. Work in the immediate area can not resume until treatment of the discovery has been completed.
- The Incident Commander (or representative) must contact WDAHP and arrange for the discovery to be evaluated by a professional archaeologist. The archaeologist will determine whether the discovery is potentially eligible for listing on the National Register of Historic Places. (36 CFR 60.4)
- The professional archaeologist will consult with WDAHP on the eligibility of the discovery for entry into the National Register. If WDAHP determines that the discovery is eligible, they will consult with the Incident Commander to determine an appropriate treatment for the discovery.

- If adverse impacts to an eligible site cannot be avoided, a treatment plan will be developed and implemented.
- NWACP Section 4313 (Cultural and Historic Preservation) must be followed.

The Secretary of the Interior's *Standards for Archaeological Documentation* must be followed; including provisions for research design, reporting, and curation of recovered material and samples. The particular data recovery measures applied to any given historic property will depend on the development of research questions, and the design of excavation strategies to acquire the data needed to answer those questions. Field notes, maps, plans, profiles, and photographs will document the process. The final report will follow style guidelines of the professional archaeological journal *American Antiquity*; it will synthesize the data collected and address the research questions posed.

6.4 – Economic Resources at Risk Summary

Socio-economic sensitive resources are facilities or locations that rely on a body of water to be economically viable. Because of their location, they could be severely impacted if an oil spill were to occur. Economically sensitive resources are separated into three categories: critical infrastructure, water dependent commercial areas, and water dependent recreation areas. A listing of Economic Resources at Risk in the WRIA 7 GRP area is available in Appendix 6A of this document.

6.5 - General information

6.5.1 Flight restriction zones: Flight restriction zones may be recommended by the Environmental Unit to minimize disturbance or injury to wildlife during an oil spill. By keeping a safe distance and altitude from identified sensitive areas, pilots can decrease the risk of aircraft/ bird collisions, prevent the accidental hazing of wildlife into oiled areas, and prevent abandonment of nests or marine mammal pupping areas.

The Air Operations Branch (Operations Section) will manage all aircraft operations related to a response and will coordinate the establishment of any Flight Restriction Zones as appropriate. Environmental Unit (Planning Section) staff will work with the Air Operations Branch Director to resolve any conflicts that arise between flight activities and sensitive resources.

6.5.2 Hazing: The Wildlife Hazing Group within the Wildlife Branch of Operations (Operations Section) handles wildlife hazing operations. These are actions intended to

minimize injuries to wildlife by keeping animals away from the oil and cleanup operations. Hazing includes acoustic or visual deterrent devices, boats, aircraft or other tools. The Wildlife Branch works with state and federal agencies, and the Environmental Unit (Planning Section), to develop hazing plans as appropriate.

6.5.3 Oiled wildlife: Capturing oiled wildlife may be hazardous to both personnel and the affected animals. Incident personnel should not try to approach or capture oiled wildlife but should report any observations of oiled wildlife to the Wildlife Branch (Operations Section).

6.5.4 Pre-cleaning of shorelines: “Pre-cleaning” refers to the temporary removal/repositioning of material (typically organic) from a shoreline before it is affected by an oil spill. *Before* starting any beach pre-cleaning, the Operations Section should provide the Environmental Unit Leader (Planning Section) with a list of beaches (with location descriptions) being considered for pre-cleaning. Environmental Unit staff will report back to the Operations Section with an evaluation of the proposed beach pre-cleaning.

Appendix - 6A

List of Economic Resources at Risk

WRIA7 – July 2013

WRIA 7

Socio-Economic Resources at Risk

A. Critical Infrastructure

A1 - Drinking Water Intakes				
Name	Location/Address	Lat/Long	Contact	Phone
Spada Lake Reservoir	Sulton, WA		Snohomish PUD	(425) 783-8800
Tolt Reservoir	Tolt River, WA		Daniel Huang	(206) 333-4192

A2 - Energy/Power Generation Water Intakes (Lock & Dams Included)				
Name	Location/Address	Lat/Long	Contact	Phone
Culmback Dam	Sulton, WA		Jackson Hydroelectric Project	(425) 783-8800
Snoqualmie Falls Project	Snoqualmie, WA		PSE Bellevue	(800) 562-1482
Tolt Dam	Carnation, WA		Daniel Huang	(206) 333-4192
Woods Creek	Monroe, WA		Snohomish PUD	(425) 783-1000
Youngs Creek Hydro Project	Sultan, WA		Snohomish PUD	(425) 783-1000

A3 - Federal or State Water Projects or Irrigation Channels for Agriculture				
Name	Location/Address	Lat/Long	Contact	Phone
No information				

Appendix - 6A

List of Economic Resources at Risk

WRIA7 – July 2013

B. Water Dependent Commercial Areas

B1 - Industrial Intakes				
Name	Location/Address	Lat/Long	Contact	Phone
No information				

B2 - Agricultural Irrigation Intakes				
Name	Location/Address	Lat/Long	Contact	Phone
No information				

B3 - Aquaculture				
Name	Location	Company Address	Contact	Phone
Tulalip Tribe		6406 Marine Dr Tulalip, WA 98271	www.tulaliptribes-nsn.gov	(800) 869-8287

B4 - Marinas				
Name	Location/Address	Lat/Long	Contact	Phone
Dagmars Marina	1871 Ross Ave, Everett, WA 98201	N 48°01'48" W 122°17'44"	Email: dagmarsmarina@clearwire.net Website: www.dagmarsmarina.com	(425) 259-6124
Seacrest Marina	4020 34 th Ave NE Everett, WA 98201	N 48.033359 W 122.186122	Seacrestmarina.com	

B5 - Commercial Fishing and Shellfish Harvest Areas				
Name	Location/Address	Lat/Long	Contact	Phone
No information				

Appendix - 6A

List of Economic Resources at Risk

WRIA7 – July 2013

B6 - Fish Hatcheries (Federal, State, and Private)				
Name	Location/Address	Lat/Long	Contact	Phone
Reiter Pond	45300 Reiter Road Goldbar WA, 98251		Doug Hatfield	(425)775-1311 x109
Tokul Creek	37501 SE Fall City-Snoqualmie Rd Fall City WA, 98204		Doug Hatfield	(425)775-1311 x109
Wallace River	14418 383 rd Ave SE Sultan WA, 98294		Doug Hatfield	(425)775-1311 x109

B7 - Specially Designated Residential, Commercial, & Industrial Areas (Includes Floating Homes & Live Aboard Marinas)				
Name	Location/Address	Lat/Long	Contact	Phone
Port of Everett	1700 W Marine View Dr. Everett, WA 98201	N 47° 59' 45" W 122° 13' 00"	Website: www.portofeverett.com	(425) 259-6001

C. Water Dependent Recreational Areas

C1 - Boating Areas		
General Location	Lat/Long (Approximate Center Point)	Remarks
Private boating is prevalent	Throughout the area.	

C2 – Public Recreation Areas				
Name	Location/Address	Lat/Long	Contact	Phone
No information				

C3 – Sport Fishing Areas	
Name	General Location/Remarks
Sport fishing occurs seasonally	Throughout the area.

Geographic Response Plan

Chapter 7 – Logistics

7.1 Chapter Introduction:

The logistical information contained in this chapter is meant to aid the response community during the initial phase of an oil spill. It may be particularly useful as the initial response transitions into a unified command. The information provided is not and should not be considered the “universe” of everything available to support a response. Additional and more current information may be found in area telephone directories, online resources, newspaper advertisements, and other media sources. The lack of information under certain categories in this chapter does not mean no logistical resources exist; only that information regarding those resources was not found or verified before creating this chapter. Chapter 5000 of the Northwest Area Contingency Plan (NWACP) also contains valuable logistical information. The NWACP is available online at <http://www.rrt10nwac.com>.

Information on Staging Areas and Boat Launch Locations can be found in Chapter 4 of this plan (see the appendices in Chapter 4A & 4B). Contact information for federal, state, tribal, and local agencies can be found on the “Spill Response Contact Sheet” located near the beginning of this plan. Detailed response resource information can be found on the Western Region Resource List (WRRRL). The WRRRL is available online at <http://www.wrrl.us>.

We value your comments. To report outdated information, or recommend additional logistical resources, please submit comments using the information provided in Appendix “C” of this plan or online at <http://www.rrt10nwac.com/Comment>.

7.2 List of Logistical Resources:

This chapter contains information on the following logistical resources:

- Aircraft Support - Helicopters & Fixed Wing
- Airports & Air Fields
- Ambulance Services (Air & Ground)
- Boat Cleaning Facilities
- Command Posts (Fixed & Mobile)

- Communications
- Cultural Resource Support
- Environmental & Conservation Organizations
- Fire Departments
- Food Services/Catering
- Hospitals & Medical Centers
- Hotels/Motels, Berthing Accommodations
- Marinas, Ports, Docks
- Military Bases/Installations
- Office Equipment Supply & Rental
- Oil Spill Response Contractors
- Outdoor Recreation Groups, Companies, & Organizations
- Park Facilities
- Rental Equipment - Industrial/Commercial
- Response Equipment Cache Locations
- River Guides
- Security Services
- Support Personnel - Local/Emergency
- Tribal Resources
- Transportation
- Wildlife Rehab Facilities & Cleaning

7.3 Logistical Resource Details:

Aircraft Support - Helicopters & Fixed Wing			
City/Location	Name/Information	Address	Contact & Other Information
Darrington, WA	Hi Line Helicopters Inc	47225 Sauk Prairie Rd, Darrington, WA 98241	Phone: (360) 436.1302
Everett, WA	Regal Air	10217 31st Ave W # C51, Everett, WA 98204	Phone: (425) 353.9123
Everett, WA	Northway Aviation	10108 32nd Ave West, Bldg C-3, Everett, WA 98204	Phone: (425) 742.7003 email: contact@northwayaviation.com
Snohomish, WA	Snohomish Flying Services	9900 Airport Way, Snohomish, WA 98296	Phone: (360) 568-1541 Fax: (360) 568-6034 Email: snofly1@harveyfield.com

Airports & Air Fields			
City/Location	Name	Address	Contact & Other Information
Arlington, WA	Arlington Municipal Airport	18204 59th DR.NE, Arlington, WA 98223	Phone:(360) 403-3470
Darrington, WA	Darrington Municipal Airport	Arlington-Darrington Rd Darrington, WA 98241	Phone: (360) 436-1454
Everett, WA	Snohomish County Airport – Paine Field	3220 100th St SW Ste A Everett, WA 98204	Phone: (425) 353-2110
Snohomish, WA	Harvey Airfield	9900 Airport Way Snohomish, WA 98296	Phone:(360) 568-1541

Ambulance Services (Air & Ground)			
City/Location	Company Name	Address	Contact & Other Information
Everett, WA	Rural/Metro Ambulance	5810 23 rd Drive West, Suite 100, Everett, WA 98203	Phone: (888) 991-7555

Boat Cleaning Facilities			
City/Location	Name	Address	Contact & Other Information
Edmonds, WA	Port of Edmonds Boat Yard	336 Admiral Way, Edmonds WA 98020	Phone: (425) 775-4588
Everett, WA	Port of Everett Marina	1205 Craftsman Way Everett, WA 98201	Phone: (425) 259-6001

Command Posts (Fixed & Mobile)			
City/Location	Name	Address	Contact & Other Information
No information			

Communications			
City/Location	Name	Address	Contact & Other Information
No information			

Cultural Resource Support			
City/Location	Name	Address	Contact & Other Information
Seattle, WA	Historical Research Associates, Inc.	1904 Third Ave., Ste 240 Seattle, WA 98101	Phone: (206) 343-0226 Website: http://hrassoc.com/

Protection Techniques

Table A-1: Summary of Protection Techniques for Onshore Areas

Protection Technique	Description	Minimum Logistical Requirements	Limitations
Beach Berms	A berm is constructed along the top of the mid-intertidal zone from sediments excavated along the downgradient side. The berm should be covered with plastic or geo-textile sheeting to minimize wave erosion.	<ul style="list-style-type: none"> · Bulldozer/Motor Grader (1) · Equipment Operators (1) · Support Personnel/Workers (1) · Plastic or Geotextile Sheeting 	<ul style="list-style-type: none"> · High Wave Energy · Large Tidal Range · Strong Along Shore Currents
Geotextiles	A roll of geotextile, plastic sheeting, or other impermeable material is spread along the bottom of the supra-tidal zone & fastened to the underlying logs or stakes placed in the ground.	<ul style="list-style-type: none"> · Support Personnel/Workers (5) · Stakes & Tie-Down Cord · Plastic/Geotextiles (3 meter width rolls) 	<ul style="list-style-type: none"> · Low Sloped shoreline · High spring tides · Large storms
Sorbent Barriers	A barrier is constructed by installing two parallel lines of stakes across a channel, fastening wire mesh to the stakes & filling the space between with loose sorbents.	<p><u>Per 30 Meters of Barrier:</u></p> <ul style="list-style-type: none"> · Support Personnel/Workers (2) · Wire mesh (70 meters x 2 meters) · Sorbents (30 square meters) · Stakes (20) · Fasteners, Support Lines, Stakes 	<ul style="list-style-type: none"> · Waves > 25 cm (~ 9.8") · Currents > 0.5 m/s (~ 1.6ft/s, ~1kt) · Tidal range > 2 meters (~ 6.5ft)
Inlet Dams	A dam is constructed across the channel using local soil or beach sediments to exclude oil from entering channel	<ul style="list-style-type: none"> · Loader (1) · Equipment Operators (1) · Support Personnel/Workers (1+) · Shovels (1 for each worker) 	<ul style="list-style-type: none"> · Waves > 25 cm (~ 9.8") · Tidal range exceeding dam height · Freshwater Outflow

Table A-2: Summary of Protection Techniques for Nearshore Areas

Protection Technique	Description	Minimum Logistical Requirements	Limitations
Containment Booming	Boom is deployed in a "U" shape in front of the oncoming slick. The ends of the booms are anchored by work boats or drogues. The oil is contained within the "U" & prevented from reaching the shore.	<u>For 150 Meters Slick:</u> <ul style="list-style-type: none"> · Work Boats (2) · Boom - 280 meters (~918ft) · Personnel/Boat Operators (2) · Personnel/Boat Crew (2) · Personnel/Boom Tenders (4) · Tow lines, drogues, connectors 	<ul style="list-style-type: none"> · High winds · Swells > 2 meters (~6.5ft) · Breaking Waves > 50 cm (~19.6") · Currents > 1.0 m/s (~ 3.3ft/s, ~2kts)
Exclusion Booming	Boom is deployed across or around sensitive areas & anchored in place. Approaching oil is deflected or contained by boom.	<u>Per 300 meters of Boom:</u> <ul style="list-style-type: none"> · Work Boat (1) · Boom - 300 meters (~984ft) · Personnel/Boat Operators (1) · Personnel/Boat Crew (1) · Personnel/Boom Tenders (3) · Anchors (6) · Anchor Lines, Buoys, etc. 	<ul style="list-style-type: none"> · Currents > 0.5 m/s (~ 1.6ft/s, ~1kt) · Breaking waves > 50 cm (~19.6") · Water depth > 20 meters (~65ft)
Deflection Booming	Boom is deployed from the shoreline away from the approaching slick & anchored or held in place with a work boat. Oil is deflected away from shoreline.	<u>Single Boom</u> (0.75 m/s knot current) (~2.5ft/s) <ul style="list-style-type: none"> · Work Boat (1) · Boom - 60 meters (~197ft) · Personnel/Boat Operators (1) · Personnel/Boat Crew (1) · Personnel/Boom Tenders (3) · Anchors (3) · Anchor Lines, Buoys, Recovery Unit 	<ul style="list-style-type: none"> · Currents > 1.0 m/s (~ 3.3ft/s, ~2kts) · Breaking waves > 50 cm (~19.6")
Diversion Booming	Boom is deployed from the shoreline at an angle towards the approaching slick & anchored or held in place with a work boat. Oil is diverted towards the shoreline for recovery.	<u>Single Boom</u> (0.75 m/s knot current) (~2.5ft/s) <ul style="list-style-type: none"> · Work Boat (1) · Boom - 60 meters (~197ft) · Personnel/Boat Operators (1) · Personnel/Boat Crew (1) · Personnel/Boom Tenders (3) · Anchors (3) · Anchor Lines, Buoys, Recovery Unit 	<ul style="list-style-type: none"> · Currents > 1.0 m/s (~ 3.3ft/s, ~2kts) · Breaking waves > 50 cm (~19.6")

Table A-2: Summary of Protection Techniques for Nearshore Areas (cont.)

Protection Technique	Description	Minimum Logistical Requirements	Limitations
Skimming	Self-propelled skimmers work back & forth along the leading edge of a windrow to recover the oil. Booms may be deployed from the front of a skimmer in a "V" configuration to increase sweep width. Portable skimmers are placed within containment booms in the area of heaviest oil concentration.	<p><u>Self-propelled</u> (None)</p> <p><u>Towed</u></p> <ul style="list-style-type: none"> · Boom - 200 meters (~656ft) · Work Boats (2) · Personnel/Boat Operators (2) · Personnel/Boat Crew (2) · Personnel/Boom Tenders (4) · Tow Lines, Bridles, Connectors <p><u>Portable</u></p> <ul style="list-style-type: none"> · Hoses - 30 meters discharge (~98ft) · Oil Storage - 2000 liters (~528 gal) 	<ul style="list-style-type: none"> · High winds · Swells > 2 m (~6.5ft) · Currents > 1.0 m/s (~ 3.3ft/s, ~2kts) · Breaking waves > 50 cm (~19.6")

Table A-3: Summary of Protection Techniques for Harbors & Bays

Where water depth is usually greater than typical boom skirt depth

Description	Tactics
Use river techniques in specific areas. Current speed dependent. Vessel traffic dependent.	Single diversion boom Current < 2 knots use boom skirt of 12 inches if no waves. Current > 2 knots use boom skirt of 6 inches or less if no waves
Currents over 2 knots	Cascade boom • Use short skirts, short boom lengths and sufficient overlap
Currents less than 2 knots and area is large	Encircling
Sufficient room to maneuver	Skimmers
Special conditions	Air and water jets
Isolated areas	Sorbents and pom-poms

Source: "Oil Spill Response in Fast Currents: A Field Guide." US Coast Guard, October 2001

Table A-4: Summary of Protection Techniques for Rivers & Canals (Non-Tidal)

Where water depth is greater than typical boom skirt depth and there may be tidal influence, but current always flows in the same direction.

Description	Tactics
Current speed dependent Vessel traffic dependant	Single diversion boom Current < 2 knots: Use boom skirt of 12 inches Current > 2 knots: Use boom skirt of 6 inches or less
Currents over 2 knots	Cascading diversion boom Use short skirts, short boom lengths and sufficient overlap
Collection areas available on both sides	Chevron booms Open for vessel traffic Closed if no traffic
Currents less than 2 knots and river is wide	Single diversion boom Exclusion boom for sensitive areas Encircle and divert to collection area
Sufficient room to maneuver	Skimmers for collection
No vessels available	Boom vane, Flow diverters
Special conditions	Air and water jets
Isolated areas	Sorbents and pom-poms

Source: "Oil Spill Response in Fast Currents: A Field Guide." US Coast Guard, October 2001.

Table A-5: Summary of Protection Techniques for small Streams, Creeks, & Culverts

Where water depth is less than boom skirt depth.

Description	Tactics
Dependent upon flow rate	Single diversion for volume greater than about 10 cubic ft/sec
Block for low volume flow	Sealing (Fill, Dams, Weirs)
Design for volume	Overflow / underflow dams
Low flow	Sorbents and pom-poms

Source: "Oil Spill Response in Fast Currents: A Field Guide." US Coast Guard, October 2001.

**Table A-6: Fast Water Booming Techniques
Current Chip Log and Maximum Boom Deflection Angle**

The table uses the time for floating debris to drift 100 feet. This is accurately determined by anchoring a line with two floating buoy markers attached at a spacing 100 feet apart. Floating

debris is then thrown into the water approximately 20 feet upstream of the first buoy marker. Determine the time it takes the debris to transit the distance between the two marker buoys in seconds. This assumes that the minimum escape velocity under a boom perpendicular to the current (90 degrees) is 1.2 feet per second. The table provides an estimate of the length of boom required for deflecting oil at a specified angle for a 110-foot profile (perpendicular length) to the current. It also provides an estimate of the number of anchors or shoreline tiebacks required for that length of boom assuming anchor points are required every 50 feet.

Time to Drift 100 Feet (seconds)	Velocity (ft/sec)	Max. Boom Deflection Angle (degrees)	Boom for 100 Foot Profile to Current (feet)	Anchors if Placed Every 50 Feet (number)
6	16.7	4.0	1,429	30
8	12.5	5.4	1,071	22
10	10.0	6.7	857	18
12	8.3	8.0	714	15
14	7.1	9.4	612	13
17	5.9	11.4	504	11
20	5.0	13.5	429	10
24	4.2	16.3	357	8
30	3.3	20.5	286	7
40	2.5	27.8	214	5
60	1.7	44.4	143	4
>86	<1.2	90.0	100	3

(1 Knot = 1.16 mile/hr, 6,080 ft/hr, or 1.7 ft/sec)

Table A-7: Current Drag Force on One-Foot Boom Profile to Current

The major force exerted on a boom is caused by the water drag on the skirt. Wave forces can increase the drag factor by two to three times depending upon the wave height, period, and loading dynamics. Wind force is less than current and waves, but is also a factor. In high current situations, drag is sometimes increased by water piling up on the boom, causing some submergence and increased drag forces, often resulting in mooring failure. In this situation, the 100-foot section of 4 X 6 diversion boom (4-inch floatation and 6-inch draft) should take the hydrodynamic load. A replacement section 50 feet long can withstand the reduced forces with submerging. The effects of current velocity and boom draft on boom drag force can be seen in the table. Drag increases with draft in a linear fashion, while current increased drag more dramatically (to the square of the velocity).

Velocity (ft/sec)	Boom Drag Force (pounds)			
	Draft 0.5 Feet	Draft 1.0 Feet	Draft 1.5 Feet	Draft 2.0 Feet
0.8	0.7	1.3	2.0	2.7
1.7	2.7	5.3	8.0	10.7
2.5	6.0	12.0	18.0	24.0
3.4	10.7	21.3	32.0	42.6
4.2	16.7	33.3	50.0	66.6
5.1	24.0	48.0	72.0	95.9
5.9	32.6	65.3	97.9	130.6
6.8	42.6	85.3	127.9	170.6
7.6	54.0	107.9	161.9	215.9
8.4	66.6	133.3	199.9	266.5
9.3	80.6	161.2	241.8	322.5
10.1	95.9	191.9	287.8	383.8
11.0	112.6	225.2	337.8	450.4
11.8	130.6	261.2	391.8	522.3
12.7	149.9	299.8	449.7	599.6
13.5	170.6	341.1	511.7	682.2

Table A-8: Approximate Safe Working Loads/Tensile Strength of New Rope

Rope Diameter (inches)	Manila No. 1 (3 strand) (pounds)	Nylon (3-strand) (pounds)	Polyester (3-strand) (pounds)
5/16	200 / 1,000	500 / 2,500	500 / 2,500
3/8	270 / 1,350	700 / 3,500	700 / 3,500
7/16		1,140 / 5,700	
1/2	530 / 2,650	1,250 / 6,250	1,200 / 6,000
5/8	880 / 4,400	2,100 / 10,500	1,950 / 9,750
3/4	1,080 / 5,400	2,750 / 5,400	2,300 / 11,500

Towing load can be significant when a boom is anchored on one end and pulled against the current. Boats must have sufficient horsepower and be properly rigged to tow. Lines must be

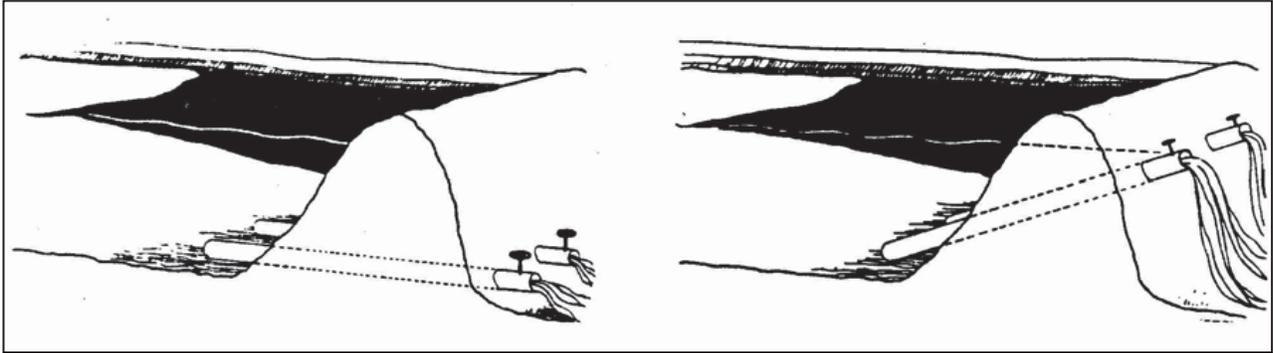

capable of withstanding the forces and the boom must have a tension member capable of high loads. If the boom is extended behind the tow boat and pulled free in the current, there is only the frictional drag along the boom. Because this drag is a function of the boat speed, proper motor size becomes a function of boom size and length, boat size, and water velocity. Although free towing drag is low, when one end of the boom is anchored to the shore, a small boat may be incapable of positioning the boom because of the high current drag exerted on the boom. The boom must be able to withstand the forces. The tension member must not become detached from the boom due to differential expansion.

Attempting to moor a boom in a straight line across a current (90 degrees) is not recommended. The result is a sag in the boom that will trap free floating oil at a point inaccessible to the shore. In swift currents, the resulting forces on moorings can cause large lines of break and present possible safety hazards. The current can be so swift that the boom may dip and become completely or partially submerged. If this happens, the boom's position should be adjusted. The total force on the mooring points will be a combination of the forces caused by current, wind, and waves.

Boom positioning is an important point. The first step is to decide where the boom should be located. It is likely that the boom will be placed on an angle to the current; therefore, the prime concern becomes the location of the upstream end. If the selected upstream location is inaccessible, a spot further upstream can be used for access and the boat and boom allowed to drift to the selected mooring site. The boom can be secured to trees, stakes, anchors, or other solid objects. Do not attach boom to vehicles of any type or size.

Figure A-1: Underflow Dams

Dams can be built in shallow rivers, culverts, and inlets using hand tools or heavy machinery, as available. Pipes are used to form an underflow dam to allow water passage out while oil stays behind, as seen in first figure below. The inlet of the pipe is cut at an angle to permit a larger entrance area for the water in order to reduce the inlet velocities and the possibility of oil drawdown due to formation of vortices. Caution should be taken to prevent whirlpools from forming and pulling the oil down. Face the cut pipe opening down (or insert a 90 degree angle) to help eliminate this. This technique is effective for water bodies less than two feet deep where flow volume can be accommodated by pipe flow. This method can also be used in deep, narrow culverts.

Earth underflow dam (DOWCAR 1997).

Sandbag underflow dam
