I am questioning the validity of the ZINC benchmark. The current benchmark is 117 BPM BPV. The 6415 suggests the benchmark of 142. Ecology studies have shown that up to 60% of samples in the Mill Creek study are above the 117; yet Ecology are proposing the draft of 109. I want to know the rationale; we are ignoring the 6415, again with a lower standard than currently requested.
