

Subject: Keep polluted runoff out of Puget Sound

Dear Bill Moore and Department of Ecology,

In the new municipal stormwater permit, I urge you to require developers to utilize green infrastructure or "low impact development" techniques wherever feasible. These "green building" techniques, such as the use of "rain gardens," pervious pavements, and retention of vegetation and native soils are the most effective way to reduce toxic runoff into Puget Sound and other bodies of water around the state. New permits should:

- Contain strong, science-based standards for LID;
- Require the retention of vegetation on site and reduction of impervious surfaces;
- Close loopholes for developers and promote LID when it is feasible;
- Support a watershed-based approach; and
- Include a larger amount of dollars for monitoring

Thank you for this opportunity to comment.

Subject: Municipal Stormwater Permit Comment

Dear Bill Moore and Department of Ecology,

The new municipal stormwater permit and LID standards, need to be strong enough to attain the end goal of keeping polluted runoff out of our Washington's rivers, lakes and Puget Sound.

I urge you to require developers to utilize green infrastructure or "low impact development" techniques wherever feasible. These "green building" techniques, such as the use of "rain gardens," pervious pavements, and retention of vegetation and native soils are the most effective way to reduce toxic runoff into Puget Sound and other bodies of water around the state. New permits should:

- Contain strong, science-based standards for LID;
- Require the retention of vegetation on site and reduction of impervious surfaces;
- Close loopholes for developers and promote LID when it is feasible;
- Support a watershed-based approach; and
- Include a larger amount of dollars for monitoring
